ANNUAL REPORT

OF THE

QUARANTINE STATION

Report of the Quarantine Station.

BALTIMORE, January 1, 1914.

NATHAN R. GORTER, M. D.,
Commissioner of Health.

DEAR SIR:

I have the honor to submit my annual report of Quarantine Station and Hospital for the year ending December 31, 1913.

The past year has been one of unusual activity at the Station, due to a general improvement in the business of the port. No quarantinable diseases, however, have entered the port during the past twelve months.

Seven hundred and fifty-three vessels were boarded and inspected. They carried crews numbering 22,297, and passengers 43,847, making a total of 73,144 persons examined during the year.

The receipts of the Station derived from tonnage tax, fumigation of vessels, care of patients, etc., amounted to the sum of $20,825.71, showing an increase of $6,115.15 over the preceding year.

Seventy cases of smallpox, four cases of other eruptive diseases and 173 suspects were cared for in the Hospital and Detention House during the year.

Nine cases of smallpox and 52 suspects were at Quarantine at the beginning of the year from the outbreak in December, in addition to which was received during the year 50 cases of smallpox, three cases of other eruptive diseases, and 107 suspects from the city.

Eleven cases of smallpox, one case of chickenpox and 14 suspects came from the counties, making a total of 247 persons taken care of at the Station during the year. Eleven cases of smallpox developed among the suspects in the Detention House and are included in the above figures.

The three tables accompanying this report show more fully the work of the entire year.

Respectfully submitted,

THOMAS L. RICHARDSON, M. D.,
Quarantine Officer.

TABLE No. 1.

Number of Vessels Boarded and Inspected at Quarantine Station During the Year Ending December 31, 1913.

MONTHS.	Number of Vessels Inspected.	Number of Persons Inspected.		
		Crews.	Passengers.	Total.
January	57	2,215	1,704	3,919
February	57	2,267	1,724	3,991
March	54	1,919	1,535	3,454
April	68	2,600	5,233	7,833
May	66	2,603	2,563	5,166
June	82	3,163	6,434	9,597
July	66	2,627	3,810	6,437
August	72	2,621	3,623	6,244
September	54	2,272	4,578	6,850

*The figures on diarrhœal diseases in children under five years of age are not complete, for the reason that prior to the year 1882 only those dying of "cholera infantum" were so classified, and from and including the year 1906, to conform with the International System of Classification, only those under two (2) years of age are included.

NOTE—In the above table the item "population," which is estimated, has been changed from and including the year 1900, so as to conform with the figures used by the United States Census Bureau. Previous to the census of 1910 the population for the inter-censal years, from 1900 on, was estimated on the assumption that the same, or more, average increase each year was maintained as was the previous decade; but the census for 1910 showed differently, and, therefore, the estimates of population and the death rate for each year has been adjusted accordingly

FINANCIAL STATEMENT

BY THE SECRETARY

Financial Statement.

Original Appropriation, Salaries		$131,780 00
Special appropriation for vaccine physicians		3,600 00
		$135,380 00

M. HARRY LAIB, *Secretary.*

ANNUAL REPORT

OF THE

DIVISION OF BACTERIOLOGY

Report of the Division of Bacteriology.

BALTIMORE, January 1, 1914.

NATHAN R. GORTER, M. D.,
Commissioner of Health.

DEAR SIR:

I herewith respectfully report on the work performed in the Division of Bacteriology of the Sub-Department of Health during the year ending December 31, 1913.

BACTERIOLOGICAL EXAMINATION OF WATER SUPPLY.

During the past year the drinking water has been treated by means of calcium hypochlorite in order to destroy the various bacteria which cause such intestinal diseases as typhoid fever, paratyphoid fever, dysentery, and other intestinal infections. The hypochlorite of calcium has been added to the water under the direction of Mr. Ezra B. Whitman, Water Engineer, and that added to the Gunpowder supply is placed in the water at the effluent of Lake Montebello. The influent at Lake Montebello has been treated with alum so that the water first undergoes sedimentation in Lake Montebello, and the clearer effluent is then treated by means of calcium hypochlorite.

When in use the Lake Roland supply has been treated by means of calcium hypochlorite at the gate chamber at Lake Roland, and for a portion of the year the alum has been added in the conduit leading from Lake Roland to Hampden Reservoir, about half a mile from the influent of this reservoir. The average amount of alum and the various amounts of hypochlorite of calcium which have been used in treating the water are given in detail below:

RECORD OF AVAILABLE CHLORINE IN PARTS PER MILLION USED IN TREATING THE CITY WATER.

January 1, 1913—Gunpowder	1.5
January 1, 1913—Jones Falls	1.5
January 10, 1913—Gunpowder	.5
January 16, 1913—Gunpowder	.8
March 4, 1913—Gunpowder	.8
March 13, 1913—Gunpowder	Gates closed
March 17, 1913—Gunpowder	.8
June 2, 1913—Jones Falls	1.25
June 22, 1913—Gunpowder	1.0
June 22, 1913—Jones Falls	1.5
August 18, 1913—Gunpowder	1.5
August 18, 1913—Jones Falls	2.0
September 18, 1913—Gunpowder	2.0
October 30, 1913—Gunpowder	1.75
November 7, 1913—Jones Falls	1.75
November 30, 1913—Gunpowder	1.5
November 30, 1913—Jones Falls	2.0

The above table shows that the amount of hypochlorite has been varied from time to time, and a later statement will show the effect of this variation upon the bacterial content of the water and the typhoid morbidity.

An average of .663 grains per gallon of aluminum sulphate was added to the Jones Falls supply at the influent of Hampden Reservoir during the months of January and February whenever the turbidity rose over 30, and from March 3 to March 29 the aluminum sulphate varied from .308 to 1.03, according to the turbidity. On April 21 the alum was added through a weir in the conduit about half way between Lake Roland and Lake Hampden, and during the next two weeks the amounts added varied between .392 of a grain per gallon and 1.03 grains per gallon. From May 12 to May 24 from .390 to .806 of a grain per gallon of aluminum sulphate were added, according to the turbidity of the water, and from August 2 to August 15, from .14 to 1.817 grains per gallon were added. From September 15 to October 18 from .386 to 1.752 grains per gallon were added and from November 9 to November 22 from .359 to .504 of a grain per gallon were added. From April 2 to July 2 from .612 to 1.976 grains per gallon were added to the Gunpowder supply at the influent of Lake Montebello whenever the turbidity required it, and from this time until the end of the year from .405 parts to 2.532 grains per gallon were added daily as a routine measure.

Bacterial Reduction Effected By the Treatment of the Drinking Water.

The results of the treatment of the two supplies by the combined method of sedimentation by means of aluminum sulphate and disinfection by means of calcium hypochlorite are shown by monthly averages giving the comparative reduction in the storage reservoirs and the city taps as compared to the raw, untreated water in the two impounding reservoirs, and tables No. 1 and No. 2 will show these results in detail.

*Increase.

An examination of the two preceding tables shows quite a high average bacterial count for the raw, untreated water, both in the Lake Roland and Loch Raven systems. The raw water from Lake Roland before treatment with calcium hypochlorite showed a maximum average bacterial count of 10,104 bacteria per cubic centimeter for January and a minimum average of 382 for June. The influence of the hypochlorite in the storage reservoirs, both with and without the use of alum, can be clearly seen from Table No. 1. With the exception of several months, indicated by asterisks, in which there was a remarkable increase in the number of bacteria, due to after-growths, the bacterial reduction in the storage reservoirs as compared to the raw water has been marked, the maximum bacterial reduction being 97.2 per cent. in February and the minimum reduction being 32 per cent. in July. This latter figure is much lower than the percentage for the various other months in which there are no after-growths, the next lowest reduction being 72.7 per cent. In June, September, November and December, the storage reservoirs showed a great increase in the number of bacteria present as compared to the raw water. This increase is due to the presence of after-growths caused by the development of bacteria which are more resistant to the effect of the calcium hypochlorite than most bacteria found in water. They are usually large, spore-bearing organisms, and as far as known play no part in the production of disease. They probably develop in large numbers at times when the less resistant bacteria and other forms of life in water are destroyed by the calcium hypochlorite, as it may be that most of their natural enemies are thus exterminated.

Upon examining the percentage of bacterial reduction of the city taps, it can be seen that this is quite variable until the month of September, since during the period prior to September the maximum bacterial reduction in the water from the city taps was 93.2 per cent. and the minimum reduction was only 7.4 per cent. This can probably be explained by the fact that the amount of hypochlorite used has been somewhat variable, but on August 18 it was increased to an amount equalling 2.0 parts of available chlorine per million parts of water, and with the exception of a short time during November, continued at this amount until the end of the year. The effect of this increase can be clearly seen by examining the column of the percentage of bacterial reduction from September to the end of the year, the maximum bacterial reduction being 99.8 per cent. and the minimum bacterial reduction remaining as high as 94.2 per cent. The good effect of the increase in the hypochlorite was not apparent in the city taps until the first of September, since the water takes from about a week to ten days to flow from the storage reservoirs through the water mains to the city taps. Beginning with the first of September there is a great difference in the bacterial counts, plates often showing no colonies per cubic centimeter, and the counts rarely reaching over five colonies per plate.

Table No. 1 also shows that during the early part of the year the percentages of positive colon tests were variable and often high both in the storage water and city tap water. The maximum for the storage reservoirs was 83 per cent. in June and the minimum was 29 per cent. in March in 10 cubic-centimeters, and even in one cubic centimeter the maximum percentage of positive tests was 21 per cent. during August and the minimum was 8 per cent. during March. The maximum percentage of positive colon tests in 10 cubic centimeters of the tap water was 62 per cent. during June and the minimum was 17 per cent. during March. The maximum percentage of positive colon tests in one cubic centimeter of the tap water was 25 per cent. during August and the minimum was 2 per cent. during March.

When one examines the results in the elimination of the colon bacillus from the water from September until the end of the year, the contrast between this period and the former months is marked, especially in the water from the city taps.

The maximum percentage of positive colon tests in 10 cubic centimeters of the storage water was 63 per cent. in September and the minimum 28 per cent. in December, whereas in one cubic centimeter the maximum was 23 per cent in September and no percentage in December. The elimination of the colon bacillus from the drinking water as it flows from the city taps and is distributed to the citizens is even more marked, the maximum number of positive colon tests in 10 cubic centimeters being 25 per cent. in October and the minimum being 2 per cent. in December, whereas in one cubic centimeter of water three of the months show no percentage of positive tests, and October shows only 4 per cent. of such tests.

The result of changing the amount of hypochlorite to a sufficient amount to equal 2.0 parts of available chlorine per million parts of water has been beneficial and has resulted in a marked reduction in the total number of bacteria present as well as of the intestinal organisms.

Table No. 2 shows the results obtained in the examination of the water from the Loch Raven system, and it can be seen that the average bacterial count per cubic centimeter has been quite variable and often high. The maximum average bacterial count of the raw, untreated water was obtained in December with an average of 33,957 bacteria per cubic centimeter, and the minimum average bacterial count was obtained in July with an average of 939 bacteria per cubic centimeter. With the exception of after-growths obtained in January and March, there has been a marked reduction in the bacterial count in the storage reservoirs, the maximum bacterial reduction being 99 9 per cent. in June, August, September, October, November and December, and the minimum bacterial reduction being 34.9 per cent. in April. The percentage of reduction in the water from the city taps has been also variable, the maximum being 99.9 per cent. in September and November, and the minimum being 26.8 per cent. in January. It can be seen that there has been a marked reduction in the bacterial count from the city taps beginning with May, although July showed a decrease in the percentage. A fairly constant and satisfactory reduction is shown from September on until the end of the year, the reduction being practically 99 per cent. of bacteria as compared to the raw water. The change in June may be accounted for by the increase in the amount of available chlorine used for disinfection to 1.00, but this was not entirely satisfactory, and the change on August 18 to 1.5, and later, on September 18, to 2.0 parts per million, with a slight reduction later, may account for the continuous satisfactory results obtained from September to the end of the year.

The presence of the colon bacillus in the raw water was not obtained for January and February, but during the rest of the year it can be seen that the percentage of positive tests has been quite variable in the various quantities of water examined. The maximum of 100 per cent. of positive tests in 10 cubic centimeters of water was noted during March, April, May, June, July, October and November, and a minimum of 90 per cent. of positive tests was noted during December. The maximum percentage of positive colon tests in one cubic centimeter of water of 100 per cent. was noted during May and October, whilst the minimum of 60 per cent. was noted during March. A maximum percentage of positive tests in the storage reservoirs in 10 cubic centimeters was 73 per cent. in May and the minimum was no percentage in October. In one cubic centimeter the maximum was 50 per cent. in May and the minimum was no percentage in October. In the water from the city taps the maximum percentage of positive tests in 10 cubic centimeters was 61 per cent. in August, and the minimum was no percentage in November. In one cubic centimeter the maximum percentage was 29 per cent. in August and the minimum was no percentage in February, October, November and December.

The percentage of positive tests in both one and 10 cubic centimeters has been variable and somewhat unsatisfactory until October, but from that time on there has been a practical destruction of intestinal organisms by means of the calcium hypochlorite. It would seem that this is due to the increase of available chlorine to 2.0 parts per million on September 18, although this has continued with its gradual reduction again, as seen by the record of available chlorine on page 528, to 1.5 on November 30. The use of less than 1.5 parts of available chlorine per million parts of water would probably prove unsatisfactory, as this seems to be about the minimum amount that will cause complete destruction of intestinal organisms in the drinking water.

The figures for the raw water and the storage water found in tables No. 1 and No. 2 have been kindly furnished by Mr. J. Bosley Thomas, director of the laboratory of the Water Board.

Table No. 3, which follows, showing typhoid fever in Baltimore from 1906 to date, shows that there was a gradual tendency towards an increase in typhoid cases which culminated in the outbreak of 1910, in which there were 1,891 cases reported and 235 deaths. About the first of June, 1911, the use of calcium hypochlorite was begun for the purpose of disinfecting the drinking water, and the table shows that there has been a gradual reduction in the cases and deaths since that time up to the present date with the exception to be noted below. The number of cases of typhoid fever during the first six months of the year 1913 compares very favorably with the number of cases reported during the same months of 1912, but during July there is a moderate increase in the number of cases, which showed a great increase during the month of August, and a continued but lesser increase during the month of September as compared to these months of 1912. Owing to this relative increase in the number of typhoid cases, the amount of hypochlorite for the Gunpowder supply was increased to 2.0 parts per million on September 18, and the typhoid fever began to show a drop about the first of October. The number of reported cases for October, November and December compares very favorably to those of previous years, and it would seem that the increase in the amount of hypochlorite, together with the routine precipitation of the bacteria in the water by means of alum, caused a diminution in the number of typhoid cases for the rest of the year.

Chart No. 1, which follows Table No. 3, shows the number of reported cases for the various years from 1910 to 1913 inclusive, together with the average number of cases from 1906 to 1910 inclusive. The legend will show the colors which represent the various years, and the number of typhoid cases is expressed by the height of the various columns in the chart. It can be seen that the blue columns representing the number of cases during the various months of 1913 are quite low until July, but during July, August and September they are higher than those for 1912. The abrupt drop again in October is well shown and the chart indicates in a graphic manner the sharp outbreak of typhoid during August of 1913, which does not compare, however, in height to the column for the same month of 1910.

An entire study of the water supply shows that the calcium hypochlorite when used in sufficient quantity is capable of checking the water-borne typhoid, but the amount which is required probably varies between 1.5 and 2.0 parts of available chlorine per million parts of water.

Chart No. 2, which has been kindly furnished by Mr. William H. Maltbie, Director of the Bureau of State and Municipal Research, shows a marked reduction in the deaths from typhoid fever per 100,000 of population in various cities which has followed the installation of filters. This chart also shows the mortality from typhoid fever per 100,000 inhabitants since 1890 in Baltimore. The average mortality due to typhoid in all of the other cities since the installation of filters is also shown by a set of interrupted lines running through these columns, thus being combined with the data from Baltimore.

This chart shows in a striking manner the great reduction in deaths from typhoid fever in the various cities following upon the purification of the water by means of filtration, and the average rate per 100,000 of the various cities since the installation of filters is seen to be 18 per 100,000 inhabitants. From 1890 to 1910 inclusive the rate in Baltimore has been variable, but always above this number, varying from 79 per 100,000 in 1890 to 24 per 100,000 in 1909. Owing to the increased number of typhoid cases during 1910 and an increased number of cases during the early months of 1911 as compared to the same months of 1910, the use of calcium hypochlorite was instituted about June 1 for the disinfection of the city water supply.

The chart shows that although the death rate for 1911, 1912 and 1913 was not reduced to the average death rate for the other cities after the installation of filtration plants, yet the death rate in Baltimore is lower than that for the vast majority of previous years, even though the population has increased. If the cases of typhoid fever during July, August and September had not increased over the numbers for the previous year the death rate for 1913 would have been lower, and it would seem that enough calcium hypochlorite to entirely eliminate the intestinal organisms from the drinking water should always be used in the future treatment of the water supply of Baltimore.

Chart No. 3, which has also been kindly furnished by Mr. Maltbie, shows in a striking manner the number of towns and villages upon the water shed of Baltimore city, any one of which may be a possible source of pollution to the water supply. In addition to these larger centers of population there are also numerous private residences scattered along the banks of the streams which supply water to the two main tributaries serving as a source of the drinking water of Baltimore. The results of the bacteriological examination of the raw water show that some of these sources must actually pollute the city drinking water, and these facts again emphasize the importance of a complete disinfection of the drinking water as far as intestinal organisms are concerned.

The results of the examination of the drinking water show that the intestinal organisms have been practically destroyed by 1.5 parts of available chlorine for the Gunpowder water, and 2.0 parts for the Jones Falls supply. The practical absence of residual chlorine from the drinking water also indicates that the amounts above mentioned are sufficient to destroy the intestinal organisms without producing a residue of free chlorine in the drinking water. It would seem that these amounts are sufficient for the proper disinfection of the drinking water during the winter months, but larger quantities should be used during the summer and autumn months. The analyses for residual chlorine were made by Mr. Craig, under the direction of Dr. Frederick C. Blanck, Chief and Chemist of the Bureau of Food and Dairy Inspection, to whom we are indebted for the information.

Table No. 4 shows the results of the analyses for residual chlorine from the city tap from each ward on October 16, CHART NO. 3

when 2.0 parts of available chlorine per million parts of water were being used, both for the disinfection of the Gunpowder and Jones Falls raw water. This residual chlorine varied between .432 parts per million and 0.0, an average of .206 parts per million. The table also shows the amount of residual chlorine obtained on November 20, when 1.75 parts of available chlorine per million parts of water were being used for the disinfection of the Gunpowder and Jones Falls supplies. The maximum amount of residual chlorine at this time was .760 parts and the minimum was .320 parts per million parts of water, the average being .574.

On November 30 the amount of available chlorine in treating the Gunpowder drinking water was reduced to 1.5 parts, and the amount for the treatment of the Jones Falls supply was increased to 2.0 parts per million parts of water. These amounts of chlorine have been continued until the end of the year, and the third column in Table No. 4 shows the amount of free chlorine which we can assume as being present about the end of December. These analyses were not made until after the end of the year, but as the conditions have remained the same it can be assumed with a fair degree of probability that the residual chlorine had practically disappeared from the water by the end of the year.

*The analyses upon which these figures are based were made during 1914, but as the amount of chlorine added to the water has not been changed since December 1, 1913, these figures probably represent the amounts of chlorine which would have been found in the drinking water about the end of December.

Chart No. 4 shows the distribution of the drinking water from the Gunpowder and Jones Falls systems throughout the different portions of the city. The legend showing the relation of the different shaded areas to the two services indicates that most of the city drinking water is either Gunpowder water or Gunpowder mixed with Jones Falls water. The Gunpowder water is impounded at Loch Raven and the Jones Falls water is impounded at Lake Roland. It is difficult to estimate just how much water is consumed from the Gunpowder supply and how much is obtained from the Jones Falls supply, but the several amounts of water used during the various months of the year are set forth in the following table which was kindly supplied by Mr. Ezra Whitman, Water Engineer. The amount of water pumped from the Gunpowder supply to the Middle Service, which is furnished mainly by the Jones Falls supply, can be seen from the table which also shows that most of the water is either Gunpowder alone or Gunpowder water mixed with that from the Jones Falls supply. The Upper Service is furnished by Jones Falls water.

The Gunpowder water furnished 69.2 per cent. of the total amount of water supplied to the citizens, and 28.5 per cent. of the total amount of water consumed consists of a mixture of Gunpowder and Jones Falls water, while only 2.2 per cent. of the total supply is furnished from pure, unmixed Jones Falls water.

TABLE No. 5—*Statement of Gunpowder and Jones Falls Water Used by the City During* 1913.

EXAMINATIONS OF WELLS AND SPRINGS.

During the past year we have examined 41 specimens collected from wells and springs within the city limits, and the table which follows shows the number of specimens in which the colon bacillus was found, as well as the number of specimens in which high and low bacterial counts were obtained. It is difficult to establish an arbitrary standard for the exact number of bacteria which would render the water pure or polluted, but pure water from unpolluted artesian wells, driven wells or springs will usually contain from 100 to 300 bacteria per cubic centimeter. Surface water may contain from 500 to 1,000 bacteria and still not show any evidence of intestinal pollution. The number of bacteria in drinking water is so variable, however, that these figures may vary widely.

TABLE NO. 6—*Wells and Springs*, 1913.

BACTERIA PER CUBIC CENTIMETER.	Number of Examinations.	Colon Bacillus Present.	Percentage Positive for Colon Bacillus.
1-500	28	17	60.7
500-1000	2	2	100.0
1000-5000	11	10	90.9
Total	41	29	70.7

The above table shows that 70 per cent. of the wells and springs examined within the city limits shows the presence of intestinal pollution indicated by the presence of the colon or intestinal bacillus. The results of these examinations have been reported to the Assistant Commissioner of Health, who has adopted all means possible to close these wells and springs.

Examination of Wells and Springs from Dairy Farms Outside of the City Limits.

We made 12 examinations of wells and springs from dairy farms outside of the city limits, and in 11 of these examinations the bacterial count was between 1 and 500 and the colon or intestinal bacillus was present in 10 out of 11 examinations. In one case the count was between 500 and 1,000 and the colon bacillus was present. This organism, an evidence of intestinal pollution, was therefore present in 11 out of 12 specimens examined in water from the dairy farms, and these facts were reported to Dr. Frederick C. Blanck, Chemist and Chief of the Bureau of Food and Dairy Inspection.

Examinations of Table Waters.

During the past year we have examined 51 samples from the different table waters sold in Baltimore. Table No. 7 shows the results of these examinations. In 11 out of 51 specimens the colon or intestinal bacillus was found. These results were reported to the Commissioner of Health, who took proper steps to correct such conditions as dirty bottles, lack of refrigeration and sources of pollution surrounding the situation of the wells and springs from which table waters were obtained.

TABLE No. 7—*Examinations of Table Waters for* 1913.

BACTERIA PER CUBIC CENTIMETER.	Number of Examinations.	Colon Bacillus Present.	Percentage Positive for Colon Bacillus.
1-100	26	2	7.6

1000-2000	4	2	50.0
2000-3000	2	1	50.0
3000-4000	3	1	33.3
4000-5000	1	0	0.0
5000-10,000	1	1	100.0
Over 10,000	2	2	100.0
Total	51	11	21.5

SPECIAL EXAMINATIONS.

Seventy-two special examinations were made for various citizens. These consisted of tests of filtered and unfiltered water, of special examinations where the citizens complained of a bad taste or odor in the water, and of examinations of several swimming pools. The results were all duly reported to the various individuals making applications for such examinations.

BACTERIOLOGICAL EXAMINATIONS OF MILK.

During the year we made 8,916 bacteriological examinations of milk, these examinations including the bacterial enumeration of the organisms present per cubic centimeter. Of these, 4,731 were collected at the various railroad stations, 701 from wagons, 547 from shops, 320 from lunchrooms, 445 from specimens examined at the plant after pasteurization, 380 specimens from milk collected at the pasteurizing plant before pasteurization, 857 original package samples of pasteurized milk collected from the wagons on the streets, 350 specimens in which usually only the streptococci and leucocyte counts were made and the ordinary bacterial count was omitted, and 585 specimens of a miscellaneous nature such as examination of milk from individual cows, examination of pasteurized milk at different stages of pasteurization, examination of milk for typhoid and paratyphoid, examination of milk for the colon bacillus as a means for determining the time of contamination, examination of milk for cause of disagreeable odor or taste, and examination of milk from hospitals to determine the quality of the milk.[*]

Table No. 8, which follows, shows the comparison by months of the milk collected from the railroad stations during 1913. This comparison is expressed by means of the bacterial index computed according to the Levy method which is described in the report of the Commission for National Milk Standards, Public Health Report No. 78. This table shows the number of specimens during the various months which were between the various bacterial counts set forth in the table, and also shows the rating for each of these sets of milk according to the Levy method. The bacterial index for each month is cited in the table, and it can be seen that this is higher as a rule in the cooler months and lower for the summer months. A high index expresses a better quality of milk in so far that this index is produced by low bacterial counts.

---

[*] One hundred and ninety of these examinations of pasteurized milk and one hundred and sixty examinations of milk from the various hospitals were made by Mr. John H. Sewell, as a special investigation for the Women's Civic League of Baltimore.

Table No. 9 shows a comparison by months of the milk collected from wagons during 1913. This table when compared to Table No. 8 shows a deterioration in the quality of the milk after leaving the station, since the bacterial index for the various months is lower than that for the corresponding months in Table No. 8.

Table No. 10, showing the comparison by months of the milk collected from the stores and dairies during 1913, shows a still more marked deterioration in the character of the milk as indicated by Levy's bacterial index, for although in one or two instances there is a slight increase in the store and dairy index for given months, yet the majority of the months shows a well marked lowering of the bacterial index for the store and dairy milk.

Table No. 11 shows that the specimens of milk obtained from the lunchrooms correspond in their general character to those obtained from the stores and dairies, and a careful examination of these four tables shows that the milk as it arrives at the railroad stations contains smaller numbers of bacteria than that present either in the specimens obtained from wagons or those obtained from the stores, dairies and lunchrooms. The wagon milk contains fewer bacteria than either the stores, dairies or lunchroom samples, the maximum figures being obtained from this last group consisting of specimens from the stores, dairies and lunchrooms.

Table No. 12 shows the result of the milk contest held by the Maryland State Dairymen's Association, from October 15 to November 15. This table clearly indicates that when sufficient care is taken, the character of the milk is very much better than that of the milk brought to the city under ordinary conditions. The large number of samples below 500,000 and the high bacterial index compared very favorably with the milk obtained throughout the various months of the year, when no special pains are taken to contest for a prize.

Chart No. 5 shows the bacterial index for the various months of the year for station, wagon, lunchroom, and dairy and store milk. The high curve for the station samples is indicated by the red line and the lower curve for the wagon samples is shown by the yellow line. This shows that the milk from the wagons has a much higher bacterial count, as indicated by the lower Levy rating, than that obtained from the various railroad stations. The milk from the so-called shops, which are really city dairies and stores, shows a still higher bacterial count, since the bacterial index is lower, and this is indicated by the curve with the black line. The lunchroom milk indicated by the curve with the green line shows a higher bacterial count than any of the other sets of milk samples, since it usually runs lower than any of the other groups. Several of the milks, however, show an exception to this rule, and it cannot be claimed that there is a very great difference between the milk obtained from the stores and dairies and that obtained from the lunchrooms as far as the bacterial count is concerned.

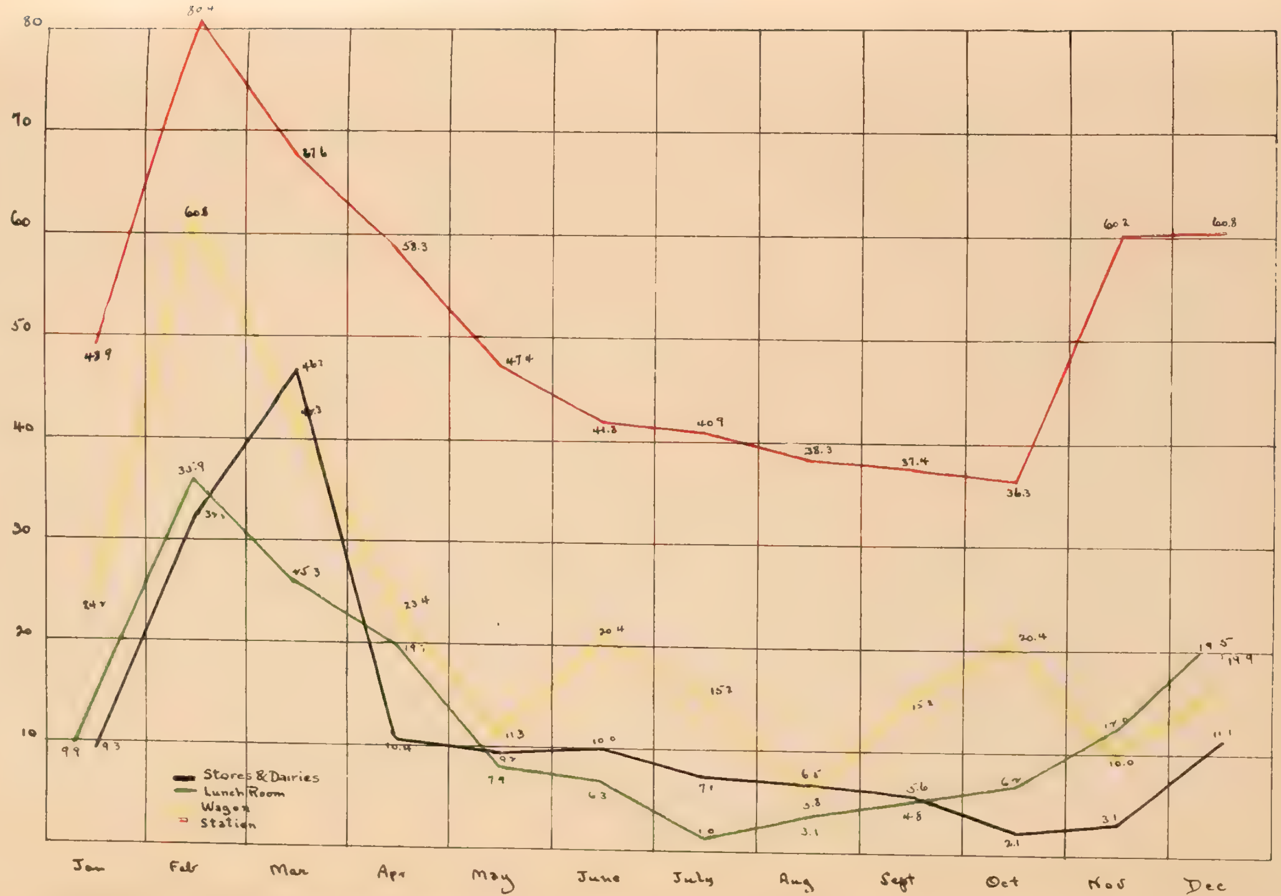

CHART No. 5—Showing graphically the bacterial index by months of milk from stations, wagons, lunch rooms, and dairies and stores.

Chart No. 6 expresses graphically by means of curves the relation between the reciprocal of the bacterial index of the station milk and the mean monthly temperature. Twice the reciprocal of the bacterial index was used to make the curves convergent instead of divergent, and it shows a remarkable correspondence between the average monthly temperature and the bacterial count as indicated by the Levy system of rating. If the simple bacterial index had been used, the curve for the temperature would have risen, while the curve for the bacteriological index would have fallen, and in order to make these two groups correspond in a graphic chart, the use of the doubled reciprocal has been adopted for illustrative purposes.

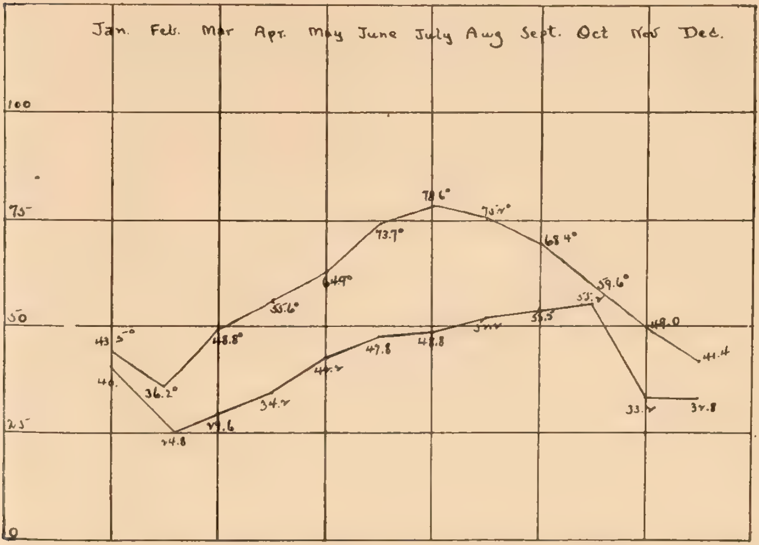

Chart No. 6—Expressing graphically the relation between the mean monthly temperature and the reciprocal of the bacterial index of station milk.

Table No. 15 shows the total number of examinations from the stations, wagons, shops and lunchrooms in which the bacterial count per cubic centimeter was under 10,000 and between the various other numbers stated in the table. It also shows the rating for the Levy bacterial index as well as the product, and the bacterial index for the year for each one of these various milks is stated at the bottom of the table. It should be remembered that the higher the bacterial index the lower the bacterial count, or in other words, the higher the bacterial index the cleaner the milk.

TABLE No. 15—*Showing the Milk Arranged According to Its Bacterial Count and So-Called Bacterial Index.*

January to December.

Bacterial Count.	Levy Rating.	Stations.		Wagons.		Shops.		Lunchrooms.	
		Number of Examinations.	Levy Product.	Number of Examinations.	Levy Product.	Number of Examinations.	Levy Product.	Number of Examinations.	Levy Product.

Bacterial index......		51.8	....	19.1	....	13.5	....	13.7	....

Table No. 16 shows the average bacterial count from the railroad stations, wagons and shops, since 1911, with the exception that in 1911, the wagon and shop samples were grouped together. The lunchroom average is only given for 1913, since milks were only collected from this source during this year. The table also shows the Levy bacterial index, and it can be seen from both of these figures that there has been a marked improvement in the character of the milk from the stations since 1911. The wagon milk has also improved since 1912, but there has been a slight deterioration in the milk of the shops as judged by the bacterial average since 1912.

Table No. 16—*Showing the Average Yearly Bacterial Count of the Milk from Stations, Wagons, Shops and Lunchrooms.*

	1911.	1912.		1913.

EXAMINATIONS FOR LEUCOCYTES AND STREPTOCOCCI IN MILK.

During the year we made 4,837 examinations by the Slack method for the detection of excessive numbers of leucocytes and streptococci in milk collected at the railroad stations. Table No. 17 shows the result of this work in detail. It might be added that in 256 examinations in which the number of leucocytes were over 1,000,000 per cubic centimeter the streptococci were under 1,000,000 per cubic centimeter; in 32 speciments in which the leucocytes were over 1,000,000 per cubic centimeter the streptococci were also over 1,000,000 per cubic centimeter; in 4,044 specimens in which the leucocytes were less than 1,000,000 per cubic centimeter the streptococci were also under 1,000,000 in the same quantity, and in 505 specimens in which the leucocytes were less than 1,000,000 the streptococci were above 1,000,000 per cubic centimeter. When the leucocytes are 1,000,000 per cubic centimeter or above this figure and there is an appreciable number of streptococci present the result is reported to the Chief of the Bureau of Food and Dairy Inspection, who has the herd inspected for garget and other inflammatory conditions of the udder. The results of the sanitary inspection of the herds following these reports are given in the report of the Chief of this Bureau, to which the reader is referred for further information.

TABLE No. 17—*Showing By Months the Results of Examination of Milk from Railroad Stations By the Slack Method.*

MONTHS.	Number Examinations Containing More than 1,000,000 Leucocytes per c. c.				Number Examinations Containing Less than 1,000.000 Leucocytes per c. c.

EXAMINATION OF MILK SEDIMENTS FOR THE TUBERCLE BACILLUS.

We have also examined 237 milk sediments, representing milk from 117 dairy farms, for the presence of the tubercle bacillus or pyogenic organisms. These specimens were all obtained from the railroad stations. These examinations were made by the following technique proposed by Kinyoun:

Fifteen cubic centimeters of milk are centrifugalized for one hour; the fluid portion is poured off and cream and sediment thoroughly mixed. Normal salt solution is added to 15 cubic centimeters, and the mixture is well shaken. It is then divided into two parts of 7½ cubic centimeters each. One part is injected untreated subcutaneously; to the other part 0.2 cubic centimeter of antiformin are added and this is brought up to 15 cubic centimeters. This is thoroughly shaken and allowed to stand several minutes, when it is centrifugalized for ten minutes. The fluid portion is poured off and the cream and sediment are mixed with two cubic centimeters of salt solution, and injected intraperitoneally.

In six specimens of milk from four dairy farms the tubercle bacillus was found. This represents an infection by the tubercle bacillus of 3.4 per cent. of the milk from the dairy farms examined. In 15 or 12.8 per cent. of cases the milks from the dairy farms were infected by the Staphylococcus aureus; In 1 or .8 per cent. of instances the milks were infected by the Streptococcus pyogenes, and in another by an organism of the paratyphoid or intermediate group. These results were all reported to the Bureau of Food and Dairy Inspection. One hundred and forty-eight examinations were made for a special piece of work, which is reported elsewhere.

NUMERICAL ESTIMATION OF THE COLON BACILLUS IN MILK.

During the latter part of the year the plan was adopted of noting all of the specimens of milk which contained over 500,000 bacteria per cubic centimeter and making a second examination from the milk obtained from the same source for the numerical estimation of the colon bacillus. When 1,000 colon bacilli per cubic centimeter or over are found in the milk, the Bureau of Food and Dairy Inspection is notified, and a dairy farm inspector is sent with the special order to investigate the conditions which might cause a contamination of the milk by means of manure from barnyards, cow stables, and other sources. If no high colon bacillus count can be detected it is assumed that the high bacterial count is probably caused by poor refrigeration or other bad methods of handling not directly connected with the barnyard and cow stable. During November of the present year, only 15 such counts were made, and in one instance 1,000 colon bacilli per cubic centimeter were detected, but in all of the other cases the counts were less than 1,000 colon bacilli per cubic centimeter.

Examination of Pasteurized and Market Milk for the Presence of the Streptococcus or Pneumococcus.

We examined 88 specimens of milk for the presence of the streptococcus or pneumococcus, and out of 40 samples of pasteurized milk we obtained the pneumococcus once and the streptococcus three times. In 28 samples of market milk the pneumococcus was obtained in one instance, and in eight samples of certified milk the streptococcus was obtained twice. In one case of pasteurized milk the streptococcus and the pneumococcus were obtained. Only one specimen of streptococcus from certified milk proved virulent for mice, and two specimens of the pneumococcus isolated gave a similar result, one being from pasteurized and one from market milk.

Examination of Raw Foods.

During the past year we have examined 34 samples of shucked oysters. These shucked oysters have been collected from the various wholesale houses and examined according to the technique of the Committee on the Bacterial Examination of Oysters of the American Public Health Association. The results have shown a marked contrast between those obtained from the shell stock, and in order that a comparison be made, Table No. 17 will show the results obtained from the shucked oysters which were published in the report for 1912.

The shell stock oysters in the above table were obtained at the various city wharves as they arrived from the oyster beds, and the results show that with one or two exceptions the bacterial counts are quite low and the score based upon the presence of the colon bacillus in the oyster juice is also low, almost always being below 50, the score which condemns shell stock according to the ruling of the United States Department of Agriculture.

The above table showing the results obtained from shucked oysters, is a marked contrast to the table for shell stock oysters, since the sanitary scores are almost always above 50 and in some cases reached 5,000. The bacterial counts are almost always high, and in a few cases have reached remarkable proportions, showing from 1,000,000 to 15,000,000 bacteria per cubic centimeter.

It is apparent from these results that there is a marked bacterial increase in the shucked stock as compared to the oysters in the shell when obtained from the oyster beds. These high bacterial counts and large numbers of intestinal organisms can be caused by various means, such as taking them from a bed polluted with sewage, floating them in fresh water polluted with sewage, using polluted water to wash the oysters, handling the oysters with unwashed and dirty hands, shucking and packing the oysters in poorly equipped and dirty shucking houses, using improper methods of refrigeration in shipping, and handling the stock in an improper manner after it has arrived in the city. It is of course difficult to say just what causes have contributed to the results obtained, and this can only be determined by a careful sanitary inspection of the methods of production from the oyster bars in the bay to the oyster bars in the city.

TABLE NO. 20—*Oysters (Shell Stock).*

Patuxent River	127-131	Mar. 18, 1913	30,360	1	2

The results shown in Table No. 20 of the examination of shell stock during the past year accorded fairly well with those obtained during previous years, and none out of the small number examined showed an actual score high enough to condemn the oysters.

A special examination was made of a lot of five oysters, as it was claimed that these oysters had produced a form of food poisoning in the persons eating oysters from this lot

The examination was negative, however, for any organisms known to produce food poisoning and the sanitary score was within the limits of safety.

York River................	199-203	May 20, 1913	2,280	0	0

The results obtained from the clams in shell stock, as set forth in the above table, show an almost complete absence of intestinal organisms and the results obtained from clams are more satisfactory than those obtained from the oysters.

In the routine investigation of the various kinds of shell fish examined we found a few intestinal organisms of a different type from that of the colon bacillus. From the shell stock we isolated the B. paratyphosus, the B. alkaligenes and the B. cloacae, each in one instance. From the shucked stock we isolated the B. paratyphosus in three instances, and in clams we isolated this organism in one instance. It should be added that the organisms of the paratyphoid type were not examined as to their special agglutinative qualities, nor was any attempt made to classify these organisms. It can only be stated, therefore, that they correspond in their general cultural characteristics to members of the intermediate or hog-cholera group.

ICE.

We examined five specimens of ice and all of these showed a low bacterial count, and none of them showed the presence of intestinal organisms.

EXAMINATION OF RATS FOR THE PRESENCE OF THE BACILLUS OF BUBONIC PLAGUE.

During the year 37 rats which were trapped along the water front by Inspector Kelly were examined by Dr. F. W. Hachtel for the presence of infection by the bacillus of bubonic plague. The examination consisted in a careful dissection of each rat, and if any suspicious signs of plague infection were discovered, careful cultures were made in order to detect the bacillus of bubonic plague. All of these examinations proved negative.

EXAMINATION OF OTHER FOOD PRODUCTS.

Amongst the miscellaneous examinations of various foods may be mentioned the examination of six eggs. None of these contained the colon bacillus in as large a quantity as one cubic centimeter, but the bacterial counts per cubic centimeter were usually quite high, being respectively 500, 1,500, 40,000, 150,000, 180,000 and 800,000 bacteria per cubic centimeter.

During the year we made eight bacteriological examinations of specimens of canned goods, which were reported to the Chief of the Bureau of Dairy and Food Inspection.

Clerical Department.

The report of the Clerical Department, under the supervision of Mr. Harry J. Campbell until the first of June, and then under the supervision of Mr. Harry L. Carman, is presented below. This shows that the total number of laboratory examinations for the past year was 37,931 as compared to 21,906 for the year of 1912. The report in detail follows as Table No. 22.

Table No. 22—*Examinations of Specimens to Determine the Presence of Disease from January* 1, 1913, *to December* 31, 1913.

Diphtheria—	
Positive cultures	1,071
Negative cultures	2,651
Suspicious cultures	13
Unsatisfactory cultures	42
Total cultures	3,777
Positive cultures of school children's throats	102
Negative cultures of school children's throats	975
Suspicious cultures of school children's throats	4
Total cultures of school children's throats	1,081
Positive cultures from throat examined by throat inspector	406
Positive cultures from nose examined by throat inspector	197
Negative cultures from throat examined by throat inspector	3,559
Negative cultures from nose examined by throat inspector	1,063
Total cultures examined by throat inspector	5,225
Tuberculosis—	
Positive results	470
Negative results	1,698
Suspicious results	32
Unsatisfactory results	13
Total results	2,213

TABLE No. 22 (Continued)—*Examinations of Specimens to Determine the Presence of Disease from January* 1, 1913, *to December* 31, 1913.

Typhoid Fever—

Positive reactions	606
Negative reactions	1,504
Suspicious reactions	192
Unsatisfactory reactions	13
Total reactions	2,315

Blood Examined for Paratyphoid—

Positive	106
Negative	357
Suspicious	30
Total reactions	493

Typhoid Bacillus from Blood Cultures—

Positive results	7
Negative results	114
Total results	121

Paratyphoid Bacillus from Blood Cultures—

Positive results	1
Negative results	90
Total results	91

Malaria—

Positive results	5
Negative results	557
Unsatisfactory results	184
Total results	746

TABLE NO. 22 (Continued)—*Examinations of Specimens to Determine the Presence of Disease from January* 1, 1913, *to December* 31, 1913.

Institutions and Hospitals Examined for Diphtheria—	
Positive results	78
Negative results	668
Suspicious results	5
Total results	751

Antitoxin—Units supplied to indigent cases	8,050,000
Tubes of vaccine used during year	96,000
Complete doses of antityphoid vaccine furnished	2,061
Complete doses of antityphoid vaccine returned	124
Miscellaneous examinations	95
Water examinations	1,337
Milk examinations	8,916
Oyster examinations	159
Ice examinations	5
Clam examinations	70
Canned goods examinations	8
Egg examinations	6
Rat examinations for bubonic plague	37
Pasteurized milk sediment for streptococci and pneumococci	88
Examination of milk sediments for tuberculosis	385
Examination of milk for leucocytes and streptococci	4,837
Examination of control cultures for disinfection	5,179
Total number of cultures	37,931

TABLE NO. 23—*Cases of Diphtheria Treated With Antitoxin Furnished by the Health Department from January* 1, 1913, *to December* 31, 1913.

			Extent of Membrane.				Complications.					Cases Immunized.		
Cases.	Deaths.	Mortality.	Tonsils.	Tonsils and Pharynx.	Nasal	Larynx.	Broncho-Pneumonia.	Nephritis.	Sepsis.	Paralysis.	Cardiac Paralysis.	Total.	Successful.	Diphtheria Developed.
365	27	7.4	165	113	29	84	1	2	3	2	4	245	240	5

Cases in which diphtheria bacilli were found....	212	Percentage of mortality....................	20.6
Deaths resulting	13	Cases of laryngeal diphtheria................	84
Percentage of mortality.....................	6.1	Deaths resulting	16
Deaths from nasal diphtheria out of 29 cases....	6	Percentage	19.1

Mortality After Use of Antitoxin According to Duration of Disease at Time of Injection.	1st Day.	2d Day.	3d Day.	4th Day.	5th Day.	6th Day.	7th Day.	8th Day.	10th Day.	2 Weeks.	Unknown.
Cases	90	98	74	33	21	6	9	2	5	5	1
Deaths	6	5	3	3	1	1	3	2	1	2	......
Percentage	6.6	5.1	4.1	9.1	4.7	16	33.3	100	20	40	......

Mortality in cases not treated with antitoxin (Welch)..42.1 %
Average mortality in Baltimore for four years (1894, 1895, 1896, 1897) prior to the use of antitoxin....55.18%

The results of the treatment of patients with diphtheria and of the immunization of persons exposed to this disease are given in Table No. 23, preceding. In 1912 we furnished antitoxin for the treatment of 419 cases of diphtheria, and 29 deaths resulted, a mortality of 6.9 per cent., and in 1913 antitoxin was furnished for the treatment of 365 cases, and 27 deaths resulted, a mortality of 7.4 per cent. In 1912 the diagnosis of diphtheria was verified by cultures from 213 cases in which only 12 deaths occurred, a mortality of 5.6 per cent., and in 1913 the diagnosis was verified in 212 cases and 13 deaths resulted, a mortality of 6.1 per cent. During the year 245 persons were immunized against diphtheria and five later developed the disease. The results in detail from the antitoxin furnished by the Department are set forth in Table No. 23, and the portion of the table at the bottom shows the increase in the percentage of mortality if the administration of antitoxin is delayed.

Distribution of Vaccines.

During the year the Division has distributed 96,000 tubes of vaccine for the prevention of smallpox. This vaccine is not prepared by the Department, however, but is purchased through the Board of Estimates by means of competitive bidding.

The laboratory has also distributed during the year 2,061 complete sets of antityphoid vaccine for the prevention of typhoid fever, and this vaccine is prepared in the laboratory. Six hundred and six sets of typhoid vaccine were furnished to physicians, and 1,455 sets to public institutions.

This vaccine is only furnished when the physician signs the following blank requesting the vaccine for a patient:

APPLICATION BLANK FOR ANTITYPHOID VACCINE.

No........................ *Baltimore*............ ....*19*......

Commissioner of Health,

Dear Sir:

I hereby make application for...
complete doses of Antityphoid Vaccine for use in protecting against typhoid fever for..
residing at... *Age*.................................
I also certify that the above person is healthy and that I shall carry out all of the directions contained in the circular of information.

....*M. D.*
(Applicant)

This application blank must be signed by the family physician before vaccine will be given out.

Along with the vaccine the following directions are issued in order to prevent any improper use of this material:

DIRECTIONS CONCERNING THE USE OF THE PREVENTIVE VACCINE FOR TYPHOID FEVER.

This package contains three ampuls of antityphoid vaccine, to be administered in doses of 250,000,000, 500,000,000 and 1,000,000,000, at intervals of 7-10 days between doses.

Sterilize syringe, shake ampul thoroughly and place it in 1 to 1,000 bichloride or 5 per cent. carbolic acid for five minutes, break off neck where it is etched and flame broken edge with an alcohol lamp or match; draw contents into syringe and inject into the arm, which has previously been scrubbed with soap and water, dried and painted at site of inoculation with Tr. iodine diluted with an equal quantity of alcohol. The injections should be made deep under the skin by pinching up a fold, but not into the muscle. After the injection the site should again be painted with the before-mentioned diluted Tr. iodine.

Inoculations should be made into alternate arms, and a new site should be selected for each injection in the region of the insertion of the deltoid muscles.

If any of the vaccine has ascended into the neck of the ampul, take the neck between the thumb and finger, bulb end downward, give it one or more quick flings, such as you would use in shaking down the mercury in a clinical thermometer, until the neck is cleared of fluid.

Notice.

Before injecting the preventive vaccine for typhoid fever the physician or health warden should explain to the person to be inoculated that the injection is apt to produce an area of redness and local pain at the seat of inoculation. The arm may also become painful, and remain so for about twenty-four hours, and occasionally the glands in the armpit may become slightly swollen and tender. A slight or moderate constitutional reaction consisting of malaise and a rise of temperature may also follow one or all three of the injections, but all of these symptoms will usually disappear within twenty-four hours. Severe reactions are of rare occurrence; untoward results have never occurred. It is best to inject the vaccine in the late afternoon, if possible, so that the person inoculated may rest during the night following the inoculation. No active exercise should be taken, such as long walks, for twenty-four hours after the injection. The vaccine should not be administered at intervals of more than seven to ten days. It should be promptly returned if it has been kept longer that the date of expiration marked on the ampul.

The typhoid vaccine should not be given to anyone who has had typhoid fever within the past seven years, nor should it be given to anyone having sugar or albumen in the urine, cardiac lesions, arteriosclerosis or any serious chronic disease. No alcoholic beverages should be taken on the day of the inoculation. The vaccine should not be used if the individual has any fever, and this should be determined by the use of the clinical thermometer.

Any prophylactic remaining unused should be thrown away and a fresh vial opened for each day's use. It should be stored in the ice-box.

This prophylactic is well borne by children and by women, using doses proportionate to the body weight, taking one hundred and fifty pounds as the unit. Women should not be given the first dose during or near the time of the menstrual period.

The prophylactic will keep for six months and perhaps longer when it is stored at a low temperature in the dark, but it is desirable to administer it as soon after its preparation as is consistent with complete and thorough tests of its purity and sterility.

The Widal reaction is always positive after typhoid prophylaxis; it appears in about ten days after the first dose and remains positive for six months to a year. This fact must be considered in diagnosing typhoid in immunized persons; they give a positive Widal regardless of the nature of the illness, and the reaction is consequently of no assistance in making a diagnosis.

The following circular is also sent out to physicians:

Circular of Information Concerning the Proper Interpretation of the Various Laboratory Tests Made by the Sub-Department of Health.

In order to obtain the best results in the interpretation of laboratory results given out by the Sub-Department of Health, there are a few points which should be considered in the use of these various tests. The results of these tests should always be considered in combination with the various clinical symptoms, and the clinical symptoms and physical signs should be given due weight in making a diagnosis. The diagnosis, therefore, should depend upon the evidence as furnished by the laboratory findings, as well as by the various physical signs and clinical symptoms. The following statement should be made concerning the use of the various laboratory tests for the several infectious diseases:

Diphtheria.

When a positive result is obtained in diphtheria the case should be treated as such, and it should be borne in mind that this disease not infrequently assumes a very mild form and that occasionally the diphtheria bacillus may be present in a case of ordinary sore throat, although it may not produce any special symptoms.

When a negative report for diphtheria is received and the clinical symptoms are those of diphtheria, the case should be treated and reported as diphtheria, since it is possible to miss the diphtheria bacillus occasionally, even when a careful swabbing of the infected area is made. Then again, the swab may not have touched the membrane itself, or the diphtheria bacillus may be beneath the surface in the meshwork of the membrane. A negative report for diphtheria should never supersede a well-grounded belief of a physician that this disease exists. This is especially true in cases of laryngeal diphtheria, when the swab itself does not come in direct contact with the membrane, which is often found only below the epiglotis.

Tuberculosis.

A positive report in tuberculosis for all practical purposes means that the disease exists. When a negative report is received, however, it should be borne in mind that the tubercle bacillus is frequently not found in the first examination of the sputum, although the disease exists and the tubercle bacillus is found in subsequent examinations. Frequent specimens should be sent for examination in cases of negative reports from suspicious cases of tuberculosis, and where the suspicion still remains the Department will be glad to inoculate animals in order to clear up any doubt. Here, again, the clinical symptoms should be given due weight and the use of tuberculin as a diagnostic agent should be employed where other methods fail to give positive results in suspicious cases.

Typhoid Fever.

It is in this disease especially where the clinical symptoms and physical signs should be given a most careful consideration. A positive typhoid reaction in the vast majority of cases means that the case is either one of typhoid or paratyphoid infection, but a few rare instances have been reported in which a typhoid reaction was apparently obtained in other diseases. The source of error from this cause, however, is very slight. A positive typhoid reaction may, however, be due to a previous unrecognized attack of typhoid fever and it may remain for several years after the patient has been inoculated with antityphoid vaccine. A positive reaction, therefore, should only be considered as a very important part of the evidence, and should be weighed in combination with the clinical symptoms and physical signs before a final conclusion is reached.

A negative report of course does not mean that the case is not one of typhoid fever, as the positive reaction does not usually occur until the end of the first week; at times is delayed until convalescence, and occasionally does not appear at all in the course of the disease. A case showing the clinical symptoms of typhoid fever should be considered and reported as such, even though the Widal reaction remains negative.

Blood Cultures in Typhoid Fever.

This would seem to be the best and earliest method of recognizing typhoid fever, and the Department of Health furnishes a complete outfit for obtaining blood cultures. The results obtained from this method in practice have been somewhat disappointing, but it is believed to be partially due to the fact that not enough blood is placed in the bile tubes. The most accurate method would be to obtain about thirty drops (two cubic centimeters) from a vein under aseptic precautions, allowing this much blood to flow into the bile tube through the hypodermic needle. If this is not possible to accomplish, from fifteen to thirty drops of blood should be allowed to flow into the bile tube. The blood culture should be made preferably during the first week of the disease, since the typhoid bacillus is present in the blood in about 90 per cent. of cases during the first week of the disease. After this the percentage of positive tests decreases.

When a positive typhoid reaction is obtained and a later negative report is received for the actual isolation of the typhoid bacillus from the blood, such reports should not be considered as contradictory. Sometimes the typhoid bacillus is isolated from the blood, while the typhoid reaction is still negative, and at times the contrary is the case. The positive test by either method should be regarded as sufficient.

Malaria.

A positive report of malaria is conclusive, but a negative report may be due to the fact that quinine has been given and the organisms have practically disappeared from the blood, or that they were too scarce to detect in the examination. A careful examination is always made of every cover slip which is properly prepared. We obtain a large number of cover slips smeared with blood for malarial examination which are impossible to examine, owing to thick smears and other improper methods of preparing the specimen.

In summarizing this matter, it might be stated that laboratory tests form a very important part of the evidence which should be weighed in making a clinical diagnosis. Allowances should be made for occasional sources of error, and the clinical signs and physical symptoms should be given due weight, even in the absence of a confirmatory report from the laboratory.

Respectfully,

WM. ROYAL STOKES, M. D.,
Bacteriologist.

Accompanying the antityphoid vaccine, a clinical information blank is also given out, and physicians are expected to return this clinical blank after the treatment, giving full information as to the result of the injection of antityphoid vaccine. The following table shows the various symptoms which were obtained from the use of the vaccine by physicians and the details of these results can be seen by an examination of the table.

TABLE NO. 24—*Showing the Symptoms Obtained from the Injection of Antityphoid Vaccine by Physicians.*

Total number of clinical blanks returned		240
Total number showing no reaction		17
Total number showing reaction		223
Local reaction		223
Redness	223	
Pain	206	
Swelling	202	
General reaction		155
Malaise	155	
Fever	145	
Headache	127	
Chills	52	
Temperature observed		84
Maximum temperature		104.0
Minimum temperature		98.6
Average temperature		100.5
Dose showing general reaction		129
First dose	129	
Second dose	120	
Third dose	93	
Dose showing most severe reaction		62
First dose	62	
Second dose	61	
Third dose	45	

REPORT OF THROAT INSPECTORS.

The report of the throat inspectors shows that 5,225 cultures were taken by the throat inspectors, Dr. W. P. Stubbs and Dr. B. P. Herzog, during the year, and of these, 603 were positive for diphtheria. The results of their examination of nasal cultures, and other interesting data are set forth in the separate report which follows at the end of my report. The large number of positive nasal cultures in which the throat cultures are negative again emphasizes the importance of passing a regulation that physicians must obtain negative cultures from the nose of the patient as well as the throat, and negative cultures from the noses of carrier or contact cases as well as the throat before such cases are released from quarantine.

Distribution of Supplies to Culture Stations.

The report of Mr. Harry Rush, distributor and maker of culture supplies, shows that 27,349 culture outfits were distributed during 1913. In addition to the distribution of culture outfits, Mr. Rush keeps a record of the various outfits distributed, collected and returned, and notifies the culture stations by postal to return all unused outfits. In addition to the 129 official culture stations there are about 65 sub-stations where the pharmacists send for their own culture outfits, and there are also a large number of institutions and hospitals which are furnished with similar materials.

REPORT OF THE DISTRIBUTION OF CULTURE OUTFITS FOR 1913.

Number of culture tubes distributed	20,944
Number of culture tubes brought back	10,647
Number of culture tubes used and sent to the Department	4,042
Number of typhoid boxes distributed	2,773
Number of typhoid boxes used and sent to the Department	2,315
Number of miscellaneous outfits distributed	99
Number of miscellaneous outfits used and sent to the Department	77
Number of sputum outfits distributed	3,418
Number of sputum outfits used and sent to the Department	2,201
Number of combined blood, urine and feces culture outfits distributed	115
Number of combined blood, urine and feces cultures used and sent to the Department	136

The Collection of Various Samples of Raw Foods.

The examination of the various specimens set forth below in the table is made for obtaining an idea of the condition of many of the raw and refrigerated foods. Mr. Edward F. Kelly, the special laboratory collector, has collected 2,949 specimens of the various raw and refrigerated foods, and the results of these examinations are described in other portions of this report. He has also visited 2,323 dairies, stores, and dwellings, and his work in detail is set forth in the table which follows.

REPORT OF LABORATORY COLLECTOR FOR THE BACTERIOLOGICAL AND CHEMICAL LABORATORIES.

	No. of Specimens.
Water, city	1,263
Water, lake	25
Water, table	48
Water, pump	19
Water, spring	28
Water, filtered	12
Water, wash	4
Water, artesian wells	6
Milk, before pasteurization	339
Milk, after pasteurization	339
Milk, original package	721
Cream	50
Ice, artificial	3
Oysters, shell	39
Oysters, shucked	34
Clams	19
Total	2,949

Number of dairies visited	339
Number of dwellings visited	1,263
Number of wagons	721
Total	2,323

EXAMINATION OF CONTROL CULTURES FOR DISINFECTION OF HOUSES AFTER COMMUNICABLE DISEASES.

During the year we examined 5,179 control cultures sent in by citizens from rooms which had been disinfected by the Department. Of these cultures, 4,860 were proven to have been destroyed by the disinfection by means of formaldehyde gas, and 319 specimens were not destroyed. This shows that the great majority of rooms disinfected by means of formaldehyde were given a thorough surface sterilization by means of this method.

SUMMARY.

The results of the examination of the water supply during 1913 show that the bacterial reduction was quite variable during the earlier months of the year, and that at times there was even a bacterial increase, due to the presence of aftergrowths. The bacterial reduction in the storage reservoirs was not constant even during the latter months of the year, but from September to the end of the year there was a decided drop in the number of bacteria present in the tap water. This was due to an increase in the amount of calcium hypochlorite added to equal 2.0 parts of available chlorine per million parts of water, and the good results continued, even though the amount of hypochlorite was gradually lessened again for the Gunpowder supply until it equalled 1.5 parts of available chlorine per million parts of water. The increase in the amount of available chlorine has also practically destroyed the intestinal organisms in the drinking water. The purification of the drinking water had quite an effect in reducing the typhoid fever for most of the months of the year, but during July, August and September, there was a relative increase of typhoid cases which rather abruptly decreased after the increase of the amount of hypochlorite added to the water. The various tables and the text describe these matters in detail.

Table No. 4 shows the amount of residual chlorine in the drinking water when the greatest amounts of calcium hypochlorite were being used, and the third set of columns shows that when 1.5 parts of available chlorine were finally employed the residual chlorine practically disappeared from the drinking water.

Table No. 5 shows the various amounts of water consumed from the Gunpowder supply and the Jones Falls supply, and indicates that a very large percentage of the total amount is either obtained from the Gunpowder water alone or the Gunpowder water mixed with Jones Falls water.

The results of the examinations of wells and springs, both in specimens obtained in the city and in those obtained from the dairy farms are described in the text, and the results of various table waters sold in the city are also described. The special examinations made for citizens for various causes can also be found following the subjects mentioned above.

The report shows that 8,916 bacteriological examinations of milk were made during the year, 4,731 being collected from the various railroad stations, 701 from wagons, 547 from shops, 320 from lunchrooms, 445 from specimens obtained at the plant after pasteurization, 380 specimens from milk collected at the pasteurizing plant before pasteurization, 857 original package samples of pasteurized milk, 350 specimens in which special examinations for streptococci and leucocytes were made, and 585 specimens of a miscellaneous nature.

The various tables found in the text show the comparison by months of the milk collected from railroad stations, that collected from wagons, that collected from stores and dairies, that collected from lunchrooms, that collected from the milk contest held by the Maryland State Dairymen's Association, that collected from the various pasteurizing plants and that collected from the pasteurized milk as sold to customers. The results are expressed by means of the Levy bacterial index and it can be seen that there is a deterioration in the milk from the time that it leaves the railroad stations until it is sold from the stores, dairies and lunchrooms. Table No. 5 also demonstrates this fact in a graphic manner, and Chart No. 6 shows the relation between the mean monthly temperature and the bacterial contamination of milk, the number of bacteria present being much greater during the warmer months.

Table No. 15 shows the yearly record of the milk collected from the railroad stations, wagons, shops and lunchrooms, and the high bacterial index for the station milk shows that the bacterial count is lower in such milk than that obtained from the other sources described in the table.

Table No. 16 is instructive, as showing the general tendency towards the improvement of the milk supply since 1911, although the data for comparison are incomplete from the shop and lunchrooms, and there is one slight increase for the shop samples during 1913.

The results obtained in the examination of milk for excessive number of leucocytes and streptococci are interesting, and the practical results obtained from inspections are described in the report of Dr. Frederick C. Blanck, Chief Chemist of the Bureau of Dairy and Food Inspection. The examination of milk sediments for the tubercle bacillus shows that in only 2.5 per cent. of the examinations were we able to obtain evidence of the bovine tubercle bacillus in market milk. These results were reported to the Chief of the Bureau of Dairy and Food Inspection, and the practical results obtained from these examinations are described in his report.

The same may be said concerning the results of the numerical estimation of the colon bacillus in milk.

A few samples from pasteurized, market and certified milk were examined for members of the pneumococcus-streptococcus group, and the results are described under this heading.

The difference between the results obtained from shell stock oysters and those obtained from shucked oysters is very striking and shows that many samples of the shucked oysters gave higher bacterial counts and higher sanitary scores than the shell stock.

The results obtained from clams of shell stock show remarkably low sanitary scores in all cases, although the bacterial counts are often quite high. It is not proven, however, that the high bacterial counts in oysters and clams have any relation to the sanitary quality of the oysters and clams.

The examination of ice and other food products is described in the text, and the examination of rats for the presence of bubonic plague is also described.

The report of the Clerical Department shows the work of the laboratory in detail, and Table No. 23 shows the results obtained from the antitoxin dispensed by the Department. A mortality of 6 per cent. in cases proven to be diphtheria by cultures was obtained for the year, and this is quite encouraging when compared to the average mortality of 55 per cent. in Baltimore before the use of diphtheria antitoxin was instituted.

Quite a large number of tubes of anti-smallpox vaccine virus have been distributed from the laboratory, and a certain number of sets of anti-typhoid vaccine have also been given out. The method employed in the distribution of this preventive against typhoid fever and the results obtained from its use are described in the text.

The report of the throat inspectors shows the large number of examinations made from convalescent and contact cases in quarantined houses, and the report of the distribution of culture supplies to culture stations and of the collection of various samples of raw foods shows the value of these subdivisions to the Department.

The results of the examination of control cultures for disinfection show that a complete surface disinfection was obtained from most of the rooms in which disinfection was practiced.

In conclusion, I desire to thank Drs. F. W. Hachtel, H. W. Stoner, W. J. Schmitz, Messrs. Raymond Freas, Fred Berger, Harry J. Campbell, Harry L. Carman, Edward Kelly and Harry Rush, and Miss L. R. Sullivan, for the faithful performance of their duties. I also wish to commend the good work of the laboratory assistants, Miss H. L. Folks, Arnold Gunther, Frank Orban, Claude Van Bibber and Lee Clark, and to thank Mr. Raymond Freas for great assistance in preparing this report.

Respectfully submitted,

WILLIAM ROYAL STOKES,
Director of Division of Bacteriology.

ANNUAL REPORT

OF THE

THROAT INSPECTORS

Report of the Throat Inspectors.

BALTIMORE, January 1, 1914.

NATHAN R. GORTER, M. D.,
Commissioner of Health.

DEAR SIR:

We herewith submit a report of the work done in that division of your Department under our charge for the year ending December 31, 1913.

In all, there were 8,975 cultures taken after diphtheria, for fumigation; of these, 3,750 were taken by the attending physicians and 5,225 by the Inspectors of Throats representing this Department.

TABLE No. 1—*Cultures Taken by Attending Physicians.*

1913.	Negative.	Positive.	Totals.
January	266	74	340
February	247	80	327
March	317	128	445
April	187	47	234

October	926	320	1,246
November	1,259	319	1,578
December	1,211	268	1,479
Totals	7,299	1,676	8,975

The striking difference in the percentage of positive cultures taken by attending physicians for disinfection over those taken by the Inspectors of Throats is due to the fact that in most instances the attending physician takes a culture from the throat of the patient only, with the request that if the culture be found free from diphtheria bacilli the Department takes the cultures from the other inmates of the infected house. So, in a large majority of cases, this Department takes a culture from the throat of the patient after the throat has already been proven free of diphtheria bacilli.

Believing that in a large percentage of the diphtheria cases the organism could be found in the nose as well as within the throat, we have during the past two years made it a rule to take a nose as well as a throat culture from the patient only. Of these nose cultures, 1,260 were taken, of which 1,063 were negative and 197 positive. This result shows that over 15 per cent. of the patients convalescent from diphtheria and reported to this Department as well by the attending physician still harbor diphtheritic germs in their anterior nares, and upon investigation we find that in about 10 per cent. of the above positive nose cultures the throat culture taken at the same time was negative.

We believe that the very high percentage of positive nose cultures would seem to indicate the necessity of a routine examination of a diphtheritic patient's nose as well as his throat before lifting the quarantine, and would respectfully offer this suggestion to apply to the cultures taken by the attending physician as well as those taken by the throat inspectors.

We believe from the above statistics and from experience that one negative culture from a throat is by no means positive evidence that diphtheria germs are not present. If practicable, two negative cultures from both nose and throat should be taken on two successive days. The percentage of error in culture taking, we think, is high enough to justify this regulation. The principal causes of error in culture taking are: carelessness, or in an intractable child, inability to touch with the swab every part of the throat.

A culture taken from the surface of the throat may be negative, due to an antiseptic gargle or spray; again, the germs may be only lodged in the follicles or crypts of the tonsils. After some little time the germs may be squeezed out of the follicles (as after eating) and again appear in the throat, at which time we would get a positive culture.

The germs may be in the anterior or posterior nares at the time the culture was taken and the throat negative, and a culture taken the next day would give a positive result.

The swab may not be rubbed and twirled carefully enough over the blood serum.

The blood serum may not be slanting enough to catch every part of the swab as it is twirled, and in this way the germs may remain on the swab and never come in contact with the blood serum.

Bad or dry media.

A swab already contaminated by careless handling.

Incubator trouble may delay the growth.

Unavoidable errors in staining and examining.

In view of the above causes, some of which are unavoidable, while others may be due to negligence or carelessness, we respectfully submit for your approval the necessity and practicability of this Department requiring two negative cultures from both nose and throat of a diphtheritic patient before that patient is released.

It seems that during this year the diphtheria germ had an unusual virulence. We have noticed more than the usual percentage of positive cultures, and by referring to last year's report you will see that during the year 1912, 623 cultures in all were found to be positive; while in the year 1913, 1,676 cultures were found to be positive. We would also call to your attention the increase in the amount of work for the year 1913. In 1912, 5,008 cultures were taken in all, while in 1913, 8,981 cultures were taken in all.

Respectfully submitted,

W. P. Stubbs, M. D.,
B. P. Herzog, M. D.,
Throat Inspectors.

ANNUAL REPORT

OF THE

Division of Food and Dairy Inspection

Report of the Division of Food and Dairy Inspection.

BALTIMORE, January 2, 1914.

NATHAN R. GORTER, M. D.,
Commissioner of Health.

DEAR SIR:

I respectfully submit herewith a report of the work accomplished in the Division of Food and Dairy Inspection during the year ending December 31, 1913.

MILK.

The amount of milk received at the various railroad depots during the year was 9,345,860½ gallons, an increase of 482,991⅝ gallons over the amount received during 1912. The average amount produced daily within hauling distance of the city was approximately 6,000 gallons. These figures give an approximate average daily consumption of 31,600 gallons, an increase of 1,300 gallons over the daily consumption of 1912. Table No. I shows the amount of milk received each month at the various railroad stations during 1912 and 1913. The data in this table has been furnished through the courtesy of the various railroad companies.

Dairy Farm Inspection.

Prior to January 1, 1913, no systematic farm inspection could be made, and so the vast majority of farms shipping milk to Baltimore were uninspected. On January 1, 1913, three dairy farm inspectors were appointed. Before beginning actual inspection work these three men were given a thorough course of instruction in city milk inspection and laboratory methods. This period of preparation was supplemented by a four weeks' course in practical dairying at the Agricultural High School at Sparks, Md. This preliminary training proved invaluable in our efforts to improve the conditions under which milk is produced for the Baltimore market. Even with this force of men, however, it has not been possible to visit all the farms shipping milk to Baltimore. The total number of farms shipping milk to the city was 1,968, of which 1,098 were visited by our inspectors. Of this number 989 shipped milk only; 29 shipped cream only, and 80 were creamery patrons whose products were later shipped to the city. The average score of these farms was 50.84. This score is considerably higher than the average score in 1912, which was 43.54.

Table No. II shows the classification of these farms according to scores. It is interesting to note that 74 per cent. of the farms visited scored between 40 and 60 on the first inspection. This condition is decidedly hopeful, as it will not require much effort on the part of these owners to increase their scores from 10 to 20 points higher, and also to accomplish the same without any considerable expenditure of money.

TABLE No. II—*Showing the Grouping of Dairy Farms by Score.*

	Number.	Percentage.
Score over 80	7	0.64%
Score between 70 and 80	17	1.53%
Score between 60 and 70	109	9.92%
Score between 50 and 60	417	37.97%
Score between 40 and 50	405	36.92%
Score between 30 and 40	74	6.76%
Score between 20 and 30	6	0.53%
Score below 20	4	0.36%
Where score could not be completed	59	5.37%
Total	1,098	100.00%

The following summary gives the results of these inspections:

Number of milk-shipping farms visited	989
Number of cream-shipping farms visited	29
Number of creamery patrons visited	80
Total number of farms visited	1,098
Number of second, third and fourth visits	301
Number of special investigations, caused by complaints, or by a bacteriological analysis of milk suggesting bad conditions	149
Total number of inspections	1.548

Milk Producing Farms.

Number of cows examined	12,681
Number of gallons of milk shipped daily	21,365
Average number gallons per cow	1.685
Average number gallons per farm	21.59
Average number cows per farm	13

Cream Producing Farms.

Number of cows examined	527
Number of gallons of cream shipped weekly	1,105
Average number of gallons per cow per week	2.096
Average number of gallons per farm per week	38.10
Average number of cows per farm	18

Creamery Patrons.

Number of cows examined	804
Number of gallons of milk sent to creamery daily	1,458
Average number of gallons per cow	1.813
Average number of gallons per farm	18.22
Average number of cows per farm	10
Number having tuberculin tested herds, 33	3.0 %
Number having small-top milk pails, 104	9.05%
Number having coolers, 43	4.00%
Number having no dairy house, 266	24.22%
Maximum score	88.00
Minimum score	12.45
Average score	50.84

In addition there were six creameries inspected which shipped a total of 500 gallons of cream to the city daily.

The above summary clearly indicates certain details of farm conditions which demand our closest attention. The percentage of farms having tuberculin tested herds is exceedingly small. It is hardly necessary for me to discuss the danger of using milk from herds infected with tuberculosis, nor is it necessary for me to discuss the economic side of this important question.

Only 9 per cent. of the farms inspected are using small-top milk pails. The use of this type of pail is a practical necessity where milk of low bacterial standard is desired. The percentage of farms inspected which have no dairy house is excessive. Unless adequate facilities are provided for the handling of milk subsequent to milking, it is difficult to prevent re-contamination of the milk. These facilities can best be furnished on the farm by a properly equipped dairy house.

In the course of our dairy farm inspection work, a considerable number of photographs have been taken, illustrating conditions and methods in use on the producing farms. These photographs are exceedingly instructive and well illustrate the many phases of the problem encountered in our daily work.

Whenever a laboratory analysis of milk showed that bad conditions existed on the producing farm, either in the handling of the milk or in some diseased condition of the herd, special investigations were made by our inspectors. In all, 149 of such special investigations were made. These investigations resulted in the temporary exclusion of milk from 251 cows and the permanent exclusion of the milk from seven cows. As a further result, the entire output of five farms was excluded, owing to insanitary conditions existing thereon. In addition to these investigations, six special investigations were made on account of the prevalence of contagious or infectious diseases on the farms. As a result of these investigations the milk from one farm was temporarily excluded from Baltimore city.

We have received daily from the State Board of Health a report of all contagious and infectious diseases occurring in those counties of the State from which milk is shipped to Baltimore. These reports have been of great value to us in checking up the prevalence of these diseases on our milk producing farms.

Acknowledgment is hereby made of the promptness of the State Board of Health in forwarding these reports and of the material assistance which they have rendered in this phase of our work.

The number of nearby farms hauling milk to the city was materially reduced during the year 1913. At the end of the year there were only 116 of such farms. The reduction in the number of these farms is probably due to a number of causes; such as the expansion of the city, increased cost of feed and greater restrictions on the character of feed used by many of these places.

As suggested in our report for 1912, a regulation was formulated by the Commissioner of Health prohibiting the feeding of certain foodstuffs to dairy cows. The following is a copy of this regulation:

Dear Sir:

Your careful attention is directed to the following regulation which I have established governing the production and sale of milk intended for consumption in Baltimore city:

No person or corporation shall keep or have in his or its possession any slops or refuse of any distillery, brewery or vinegar factory, or any mash or refuse, or any canning factory refuse, or food that has been subjected to fermentation, for the purpose of feeding the same to any milk cow or cows.

The above regulation is effective on and after July 1, 1913, and all milk from cows fed on the above foods will be regarded as impure within the meaning of the laws governing the sale of milk in Baltimore city.

Nathan R. Gorter,
Commissioner of Health.

The necessity for such a regulation must be apparent to anyone who visits establishments where such feeding is practiced. The sanitary conditions, even under the best of conditions, are bad and are absolutely inimical to the production of clean milk. This practice has been in existence for many years and consequently the passage of such a regulation created a tremendous stir among this class of milk producers.

On October 17, injunction proceedings were instituted by these producers to restrain the Commissioner of Health from enforcing this regulation. Unfortunately, this case has not been tried as yet and so we have been unable to enforce this necessary regulation.

CITY MILK WORK.

The store problem still continues to be one of our great problems in the local distribution of milk. Constant inspection and supervision are required, as many of the store owners do not seem to comprehend the meaning of the word "cleanliness," nor have they any idea as to the necessity for proper care in the handling of milk. These problems are still further increased by the large number of foreigners operating stores.

The problem of dispensing bulk milk in these stores is an ever present and serious one. Until we have adequate laws controlling the sanitary condition of these establishments and a law prohibiting the sale of dipped milk, it will be exceedingly difficult for us to improve these conditions.

During the year a new form of score card was introduced for recording the results of our inspection of stores. This score card is modelled after the standard government score card and should prove of value to us in recording existing store conditions.

Attention must again be directed to the small dairy problem in so far as it concerns their equipment or lack of equipment for the proper handling of milk. The details of our local dairy inspection are given in our 1912 report. In general the conditions in these dairies were practically the same in 1913. Here again it is necessary for us to have adequate laws which will compel all dairies to have at least a certain minimum equipment before being licensed to operate as dairies.

An important advance was made during the year in our procedure involved where permits have been revoked. Heretofore after a milk permit had been revoked, it was merely necessary to make application for another permit, and, if conditions were satisfactory, another permit was granted. By this old method the person could readily become a chronic offender against our milk regulations, and yet not be made to suffer. Under the new procedure, after a permit has been temporarily revoked twice for violations or infractions of our rules and regulations, a notice is sent to the offender to appear before the Commissioner of Health on a certain day to show cause why this revocation of his permit should not be made permanent on and after a certain day. At these hearings opportunity is given to the Department and also to the accused to present both sides of the case. After hearing all the evidence in the case, the Commissioner of Health passes judgment.

In accordance with this new method 13 revocations for the sale of milk and cream were made permanent. In addition to these, there were 187 temporary revocations of milk permits for various infractions of the Department rules and regulations. The number of milk permits effective December 31, 1913, was 3,430, divided as follows: local dairies, 211; dairies in the county, 29; county producers vending milk in the city, 116; stores and lunchrooms, 3,074.

Chart No. 1 graphically illustrates the difficulties surrounding the local distribution of our milk supply.

CHART No. 1.

Table No. IV summarizes the work accomplished by our milk inspectors during the year. Only 6.1 per cent. of the total amount of milk received at the railroad depots was inspected. This inspection includes the lactometer, dirt and temperature tests, and inspection of the cleanliness of the container. Of the total amount of milk inspected, 7,312⅞ gallons were condemned and destroyed.

TABLE NO. IV—*Showing the Amount of Work Done by Milk Inspectors, by Months, During* 1913.

MONTHS.	Amount of Milk Received at Depots.	Amount of Milk Examined.	Amount of Milk Condemned.	Dairy and Milk Shop Inspections.	Wagon Inspections.	Railroad Depots Visited.

PASTEURIZING DAIRIES.

Whereas there were only six pasteurizing dairies in 1912, there were 19 such plants in 1913. Realizing the importance and necessity for a careful supervision of all such establishments, a preliminary survey was made during the latter part of the year to obtain detailed information of the operation of these plants. This data is summarized as follows:

Records Obtained from Eighteen Dairies.

These 18 dairies have a total daily output of 12,300 gallons of milk and 380 gallons of cream, and serve a total of 43,450 customers. The largest delivers 4,000 gallons to 13,000 customers, and operates 50 wagons and employs 125 helpers. The smallest delivers 60 gallons to 200 customers. Three of them sell bottled milk only, and the other 15 sell both bottled and bulk milk. The total daily output of bottled milk is 10,044 gallons and of bulk milk is 2,256. These 18 dairies operate 172 wagons and have 365 employees. Sixteen of them are supplied by 746 dairy farms, and two of them produce their own milk.

A general survey of the 18 plants shows the following: There are nine of them using the "flash" type of pasteurizer and nine of them using the "holding" type. The time of pasteurization ranges all the way from two minutes to 30 minutes.

In 2 plants the time is 2 minutes.
In 1 plant the time is 4 minutes.
In 9 plants the time is 5 minutes.
In 1 plant the time is 10 minutes.
In 3 plants the time is 25 minutes.
In 2 plants the time is 30 minutes.

The temperature of pasteurization ranges from 140 degrees to 155 degrees Fahrenheit.

In 1 plant the temperature is 140 degrees.
In 10 plants the temperature is 145 degrees.
In 6 plants the temperature is 150 degrees.
In 1 plant the temperature is 155 degrees.

The holding apparatus in the eight which use that type differ as to construction. Three plants have each one continuous holding tank. Four plants have one tank with eight compartments. One plant has one tank with seven compartments. The temperature in the holder is 145 degrees in seven cases, and 148 degrees in the other case.

Three plants use a regenerator, and one plant uses a clarifier. In three plants the milk is run over an aerator prior to pasteurization. In six plants the pasteurized product is cooled without exposure to the air. The bottle filler in 14 plants was protected from exposure; 14 plants cap by hand and four by machine.

There are nine plants which have facilities for sterilizing bottles. The other nine clean them with hot water.

There are 16 plants which clean their pasteurizing apparatus by the use of live steam, and the other two use only hot water.

Storage facilities show temperatures ranging from 35 degrees to 45 degrees, the majority of cases showing 45 degrees. Two plants merely immerse their containing vessels in ice water. The time of storage before delivery ranges from nine to 24 hours.

Dairy farm inspection is carried on by five of these dairies. Four of them carry on laboratory work to show the efficiency of their plant and to analyze their raw product. In one case a premium is paid for a low bacterial count, and in one case a premium for high butterfat.

A careful study of this data shows the necessity for prompt and effective regulation of all such plants. The temperature and time of exposure in several of the plants using the flash type of pasteurizer are entirely inadequate to insure the destruction of pathogenic organisms, which consideration is the main purpose of pasteurization. Further, only nine of the 18 plants have facilities for the sterilization of bottles. Obviously, unless the pasteurized milk is placed in sterile bottles or other containers, much of the value of pasteurization will be lost.

The increase in the number of our pasteurizing plants renders imperative the formulation of suitable regulations or ordinances governing this process. At the present time, dairies contemplating the erection of pasteurizing apparatus, do so on their own responsibility, and without the necessity of securing any approval from the Health Department. Unless this condition is promptly remedied, we will have considerable difficulty in correcting these conditions in the future.

Table No. XXIII shows the tabulated results of bacteriological examinations of the milk supplied by the various pasteurizing dairies in 1913.

It is evident from the foregoing data that much of the pasteurized milk sold in Baltimore is pasteurized in name only, and that the product in many instances is little, if any, better than the average raw milk sold in Baltimore.

Quality of Milk.

Tables Nos. XXIV-XXVII give the average percentage of butterfat, total number of samples above and below the legal standard at the different stages in the distribution of our milk supply. These averages are practically identical with those of previous years with the exception of the store samples which are somewhat lower. Here, again, it is evident that faulty and improper methods of handling, due in the main to ignorance, are largely responsible for this condition.

CHART NO. 3.

The summarized bacteriological data is presented in Table No. XXVIII. These are of the greatest interest in showing what improvement, if any, has been made in our milk supply, and also in again focusing attention on the store problem. That a marked improvement has been made in the bacterial count of milk from the farms is highly gratifying. During the first year of our dairy farm inspection we have succeeded in lowering the average bacterial count of farm milk from 2,557,500 bacteria per c. c. in 1912, to 1,070,000 in 1913. In 1913, 71 per cent. of all station samples examined conformed to our raw milk bacteriological standard of 500,000 bacteria per cubic centimeter, whereas, in 1912 only 44 per cent. met this standard. I believe that this very marked improvement has been influenced primarily by the increased activity of our Department in this direction. The condition and improvement in the bacterial content of our milk supply is graphically illustrated in Charts Nos. 2 and 3.

The improvement noted in our milk supply from farms is also evidenced in the improved quality of milk as distributed by the wagons, although the improvement is not near so marked as in the case of farm milk. Both these charts again illustrate the difficulty of properly controlling the milk supply of stores under our present conditions. A further reference to these latter conditions will be made under the heading of "Local Food Ordinances and Conditions."

BAKERY INSPECTION.

Table No. XXX shows the number of bakery inspections and the number ordered cleaned by months throughout the year.

The general conditions with regard to construction and general condition noted in our 1912 report are equally true of our bakeries in 1913. Through the efficient and active work of our Bakery Inspector, conditions have improved as much as possible under the existing surroundings. Emphasis must again be laid on the necessity for a thorough revision and modernization of our bakery ordinance. Such an ordinance should require that no new bakery be established, nor that any old bakery be remodelled, without the written approval of the Commissioner of Health. No bakeries should be permitted below the level of the street.

ABATTOIR AND SLAUGHTER-HOUSE INSPECTION.

Table No. XXXI shows the amount of live stock examined by months during the year; the number of carcasses condemned will be found in Table No. XXXIV.

We are very greatly handicapped in this important work by the lack of suitable ordinances and insufficient inspection service. There are 79 such establishments not operating under the United States Government inspection. All these plants are visited by one inspector. Under government inspection there is at least one inspector at each plant. Obviously, it is impossible for us to control and supervise them properly with only one inspector. One solution of this problem would be the establishment of a municipal abattoir owned and operated by the city. This institution was originated in Europe and has proven very successful. The same system has been advocated by the foremost authorities in this country, and steps have already been taken in some parts of the country toward their establishment. By this means, all slaughtering of animals intended for human consumption would be under the direct supervision of the city and a suitable inspection stamp could be placed on all carcasses.

GENERAL FOOD INSPECTION.

Table No. XXXII shows the number and character of the inspections made by the food inspectors by months during the year 1913. The classification of the various foodstuffs condemned by these inspectors will be found in Table No. XXXIV. The large increase in the number of store and market inspections is due to the appointment of an additional food inspector on January 1, 1913. Whereas, the total amount of foodstuffs condemned in 1913 is much less than in 1912, I believe that our work has been more effective in that a considerable amount of foodstuffs has been condemned in the smaller stores.

Great difficulty has been experienced in securing sanitary conditions in the small stores handling a general food supply. We have been compelled to resort to time consuming measures in order to correct existing conditions. Our work in this direction would be greatly facilitated by a suitable ordinance regulating the sanitary condition of such places.

WATER.

The water examinations throughout the year were of a somewhat different nature than those of the preceding. The usual examinations of the Loch Raven and Lake Roland supplies were conducted during the first part of the year, but thereafter discontinued to allow for the examinations of all the leading table waters. The majority of these table waters were found to be of good quality.

A new phase of the water work was introduced by the surveying and analyzing of a number of water supplies upon the local dairy farms. Most of these examinations were conducted in conjunction with a bacteriological examination.

It is the intention of this Division to further elaborate a scheme, in this phase of the work, by which the water supplies of dairy farms shall be examined, with suggestions for a possible improvement of such supplies.

As was the custom in preceding years, a number of springs and wells in the city's parks were examined and recommendations for the condemnation of several followed; likewise, the regular examination of pumps lying within the city limits was continued with recommendations for the condemnation of all.

The water used in the manufacture of ice by several of the leading ice manufacturers was also examined upon the request of the several railroads using the ice of these concerns.

The total number of water samples examined during the year was 163.

COMPLAINTS.

During the year, 110 complaints were received and investigated against the character of foods offered for sale and the sanitary condition of premises where foods are exposed for sale and violations of regulations governing the handling of milk.

Eighty of these complaints were against sanitary condition of stores, lunchrooms, market stalls, etc., and the condition of the foodstuffs. Of these, 29 were found to be in satisfactory condition; 47 showed the presence of decomposed or bad foodstuffs; four showed the premises to be in a dirty condition.

Four complaints were received from citizens of unsound meat having been sold to them. Upon investigation the meat proved good in two cases and bad in the other two. Subsequent investigation of the places where the meat was purchased showed bad foodstuffs in two places.

Fourteen complaints were received of milk being sold without a permit. Investigation revealed the fact that five of these complaints were groundless and nine were correct.

Ten investigations were made of milk shops reported to be in bad condition. Of this number four were found to be in good condition and six in bad condition.

Two investigations were made of the use of pasteurized bottle caps on unpasteurized milk and the conditions were corrected.

LABORATORY WORK.

Table No. XXXIII shows the number of examinations made in the chemical laboratory during the year. As customary, milk work has largely predominated. The miscellaneous examinations include a variety of foodstuffs and analyses of samples submitted by the Police Department. The scope of our routine laboratory work must be enlarged so as to cover a broader field. Such work is necessary also in order to secure data as a foundation for new standards for local food ordinances. In order, however, to accomplish this additional work, it will be necessary to curtail our milk work considerably.

TABLE No. XXXIII—*Showing the Number of Milk, Water and Miscellaneous Chemical Analyses Made,* 1913.

PROSECUTIONS.

After a fair warning had been given and a reasonable time allowed for corrections to be made, prosecutions were instituted against 44 persons for violations of various food ordinances. The cases and results of the trials were as follows:

For selling milk without a permit, guilty	17
For selling milk without a permit, stet	2
For selling milk without a permit, dismissed	5
For selling milk containing less than 3.5 per cent. butterfat, guilty	5
For selling milk containing less than 3.5 per cent. butterfat, stet	1
For selling milk containing less than 3.5 per cent. butterfat, dismissed	1
For filling milk bottles on public highway, guilty	1
For selling unsound meats, vegetables and canned goods, guilty	7
For selling unsound meats, vegetables and canned goods, dismissed	1
For returning unwashed cans to shippers, guilty	2
For returning unwashed cans to shippers, dismissed	1
For failure to report case of infectious disease, guilty	1
Total number of prosecutions	44

In addition to the foregoing, 37 sealed samples of milk were obtained for prosecution, but all either exceeded the legal standard or were so close to the standard as not to warrant prosecution. These samples were classed as follows: wagons, 29; lunchrooms, 5, and stores 3.

Local Food Ordinances and Conditions.

Attention must again be focused on the inadequacy of our local food ordinances. No legislation has been added to our statutes since the passage of the milk ordinances in 1908. If the work of our inspection division is to be made effective we must have adequate and enforceable laws and a rapid and comprehensive system for the abatement of bad conditions. Our existing food laws, with the exception of milk, are lacking in definiteness and apply more to the character of the foods sold than to the sanitary condition surrounding the preparation or keeping of foodstuffs.

Experience has clearly shown that certain amendments or additions are imperative in our milk ordinances. The section dealing with milk permits should be so amended as to provide for the issuance of permits annually, at a nominal charge. By such a system we could keep a better record of the licensed establishments and the number of such establishments would undoubtedly be materially decreased.

In many of the stores in Baltimore conditions are such as to render it impossible to sell milk under sanitary conditions. The only remedy in such a case is either to prohibit entirely the sale of bulk milk or to compel the sale of bottled milk only. The prevention of the sale of milk on such premises would undoubtedly work a great hardship in many localities in the city.

Considering all the factors involved, I believe that the more satisfactory plan will be to require that all milk sold in Baltimore city in quantity of less than one gallon be sold in the original, unbroken package.

The tremendous increase in the number of pasteurizing dairies, already referred to, directs our attention to the urgent necessity of having proper ordinances or regulations defining this process. Inasmuch as such control will necessitate many changes and improvements in our city milk plants, ample time will have to be allowed for the required changes to be made. Under these conditions I respectfully recommend that suitable pasteurizing regulations be established to take effect within 12 months of the passage of this regulation and that on and after July 1, 1915, all milk sold or offered for sale in Baltimore shall be pasteurized in accordance with such regulations with the exception of certified or similiar high grade raw milk.

Our only existing general food law is characterized by a vagueness which has rendered it practically useless in the prosecutions of certain cases. The phraseology of this ordinance requires revision and should be so amended as to include the food standards now used by our State and National Government. By this means we would have uniformity in standards and prevent the sale in Baltimore city of foodstuffs manufactured here which cannot enter into interstate shipment.

We have an urgent need for the passage of an ordinance covering the sanitary condition of establishments manufacturing or offering foodstuffs for sale.

In conclusion I wish to commend Chief Inspector W. P. Palmer; our clerk, Mr. M. J. Gahan; our stenographer, Miss A. R. Fisher, and our assistant chemists, Messrs. Howes, Siegmund and Craig, for the faithful performance of their duties and the interest manifested in our work.

Respectfully submitted,

FRED C. BLANCK, PH.D.,
Chemist and Chief, Division of Food and Dairy Inspection.

CONDENSED MILK.

By R. Sewell Craig, B. S., *Assistant Chemist.*

The most available statistics show a 30 per cent. increase in the use of this type of milk in this city during the last five years, of which increase 10 per cent. occurred during last year. In view of the fact that condensed milk is yearly becoming a more conspicuous factor in our milk supply, it was deemed advisable to conduct an investigation as to the quality of the leading brands, and if possible, to render an adequate and enforceable standard by which to better control the sale in this city.

The term condensed milk is used to signify either the sweetened or the unsweetened variety, but the latter type is often designated by "evaporated cream." This product, however, as sold on the market, rarely ever resembles cream in any respect except consistency.

Condensed milk is made by evaporating milk in vacuum pans to the required degree of concentration and sealing in air-tight containers. The difficulties in the manufacture may well be mentioned and be given due consideration in fixing a standard.

The unsweetened variety is fresh milk condensed at the ratio of about two parts of fresh milk to one of evaporated milk. It is preserved by being sterilized by heat under pressure. Absolute sterility is essential and the milk is usually subjected to a temperature of from 226 to 245 degrees Fahrenheit. Without this sterilizing process it is possible to carry the evaporation nearly to dryness. But if the evaporation has been carried to too high a degree, the action of the sterilizing heat will precipitate a hard, insoluble curd which is not capable of being homogenized, and the product is in an unmarketable condition. Many factors influence the action of this sterilizing heat upon the milk, the most important of which is probably the care of the milk before it reaches the condensory. The period of lactation, the breed, care and feed of the cows also influence the composition and properties of milk.

The sterilizing process cannot be modified to any appreciable extent without endangering the product. Milk that is not sterile will ferment and in this condition is utterly worthless. On the other hand if the concentration has not been carried far enough, the butterfat may be separated on standing and churned in transportation; this product is also unmarketable. It will be observed that the limits of the degree of concentration are indeed narrow in this type of milk.

The difficulties governing the manufacture of sweetened condensed milk are few compared with the unsweetened type. This product is not sterilized by heat, but is preserved by the sugar which is added. Fresh milk is evaporated at the ratio of about 2½ to 2¾ : 1 and cane sugar added to the required amount. The principal difficulty is in having a product too thin to hold the sugar in suspension, the latter depositing at the bottom of the can. Thin milk is more liable to undergo decomposition than a more concentrated product. The breed of the cow may affect the butterfat content, but this is a factor which the manufacturer can control to a certain extent; so the difficulties in the preparation of this type to meet the Federal standard are indeed few as compared with unsweetened milk.

The Federal Food and Drugs Act, which went into effect January 1, 1907, defines condensed milk as follows:

"Condensed milk, evaporated milk, is milk from which a considerable portion of water has been evaporated and contains not less than twenty-eight (28) per cent. of milk solids of which not less than twenty-seven and five-tenths (27.5) per cent. is milkfat.

"Sweetened condensed milk is milk from which a considerable portion of water has been evaporated and to which sugar (sucrose) has been added, and contains not less than twenty-eight (28) per cent. of milk solids, of which not less than twenty-seven and five-tenths (27.5) per cent. is milkfat.

"Condensed skim milk is skim milk from which a considerable portion of water has been evaporated."

The law governing the handling and sale of condensed milk in this city may be abstracted as follows:

"No condensed or preserved milk shall be manufactured, sold or exchanged, or offered or exposed for sale or exchange, unless the same be manufactured out of pure, clean, healthy, fresh, unadulterated and wholesome milk, from which the cream has not been removed either wholly or in part, or unless the proportion of milk solids of same shall be in quantity the equivalent of twelve and fifty-one hundredths and of which milk solids three and fifty-one hundredths per centum shall be butterfats."

The only method of estimating the amount of fat and milk solids in the original milk is by calculation from the fat and milk solids in the condensed milk. This was done according to Leach ("Food Inspection and Analysis," page 192), assuming a solids-not-fat content of 9 per cent. This calculated percentage is at best only an approximation, however close it may be.

In this investigation twenty-three samples were collected, which included practically all the brands sold in this city.

The methods followed in the analyses were those given in United States Department of Agriculture Bulletin No. 107, pages 122 and 123. Cane sugar was estimated by difference.

	Mean.......	7.83	3.87	7.11	9.17	1.36	26.25	.77	....

†Does not include Sample No. 16.

From the above data it is evident that the Federal standard for sweetened condensed milk is reasonable and just and I therefore recommend that this be the standard by which to control the sale of this variety in this city.

The difficulty of incorporating the required 28 per cent. of milk solids in unsweetened milk is clearly shown. In fact only one sample contained over this amount. The average of the eleven samples is 26.25 per cent., which is 1.75 per cent. below the Federal standard.

A more recent food inspection decision of the United States Department of Agriculture takes into consideration the difficulties under which this product is manufactured and formulates a regulation in which the percentage of fat must be 7.8 per cent. and the sum of the milk solids and fat must equal 34.3 per cent. The fat content is one over which the manufacturer has more or less control and this modification would allow a small reduction in total solids with a corresponding increase in fat.

The following requirements have been abstracted from the United States Department of Agriculture Food Inspection Decision No. 130, on the composition of evaporated milk (i. e., unsweetened condensed milk):

(1) "It should be prepared by evaporating the fresh, pure, whole milk of healthy cows, obtained by complete milking and excluding all milkings within 15 days before calving and seven days after calving, provided at the end of this period the animals are in a perfectly normal condition.

(2) "It should contain such percentages of total solids and of fat that the sum of the two shall be not less than 34.3 per cent., and the percentage of fat shall be not less than 7.8 per cent.

(3) "It should contain no added butter or butter oil incorporated either with whole milk or skimmed milk or with the evaporated milk at any stage of manufacture."

SUMMARY AND CONCLUSION.

Twenty-three samples were examined, including twelve of the sweetened variety, and eleven of the unsweetened type. Practically all of the samples of unsweetened milk conformed to the requirements of the recent food inspection decision and the sweetened type to the Federal standard.

It is believed that these standards are adequate and enforceable and attainable by the manufacturer throughout the year, and I recommend their use as a local ordinance.

The use of the Federal standard for condensed skimmed milk is also recommended as an adequate regulation by which to control the sale of this product.

ANNUAL REPORT

OF

SYDENHAM HOSPITAL

Report of Superintendent of Sydenham Hospital.

BALTIMORE, December 31, 1913.

NATHAN R. GORTER, M. D.,
Commissioner of Health.

DEAR SIR:

I herewith submit the report of Sydenham Hospital for the year 1913. As introductory remarks, please allow me to state that no patient suffering with diseases that we are able to care for was refused admission when space was available, which accounts for the high percentage of deaths occurring within 24 hours after admission.

I am pleased to report that 1913 was a banner year in the number of patients admitted, outnumbering by far any previous record.

I would also call your attention to the number of refusals that were made necessary on account of lack of space and facilities. Sydenham Hospital accommodated one-ninth of the cases of scarlet fever and diphtheria alone that occurred in the city for 1913. The capacity at times was greatly taxed. Only a small fraction more could have been treated. I sincerely hope that in the near future greater facilities will be provided for the care of patients suffering with these and other minor infectious diseases.

I will only speak here to call your attention to the high cost per patient per day, the details of which you will find in the Superintendent's report.

I take this opportunity to express my sincere thanks and appreciation for the hearty co-operation that you have given the Hospital, and the patience you have shown me in my exorbitant demands upon your time.

Most cordially yours,

S. T. Nicholson, Jr., M. D.,
Resident Physician and Superintendent.

SYDENHAM HOSPITAL.

STAFF.

S. T. Nicholson, Jr., M. D.	*Superintendent.*

H. C. Davis, M. D.	*Consulting Otologist.*
Arthur M. Shipley, M. D.	*Consulting Surgeon.*

SUPERINTENDENT'S REPORT.

Sydenham Hospital has just passed through one of the busiest years of its existence, also one that points out its limitations and possibilities.

For the most part parents have signified their willingness to send their children early in the disease. Patients have also been sent here as a means of "last resort," and in no instance were they refused admission when accommodation was available. This, to some extent, accounts for the high mortality.

The demands for the treatment of the infectious diseases were greater than the Hospital could supply, particularly infectious diseases other than scarlet fever and diphtheria, which points out the great need of a miscellaneous ward in combination with a detention and observation ward.

The beginning of 1913 found the buildings in a rundown condition as well as a torn up lawn on account of sewer and heat line excavations. The first attempt was to take inventory of the urgent needs. So much had to be done that the cost of maintenance of patients was necessarily high, whereas, the cost of subsistence was very satisfactory and gratifying, being less than 33 cents per day per person. This could be markedly decreased if a refrigerating system were installed for the present facilities are only adequate to carry one day's provisions over to the next. As there were 12,844 days, buying in wholesale lots would decrease the maintenance. As to the cost of maintenance of patients, this neither can be reduced to any appreciable extent until the capacity is increased. There is on the pay roll of the Hospital an average of employes equal to that of patients admitted. A greater number of patients could be cared for at a proportionate decrease in cost. The fact must not be overlooked that the

Hospital is so far from the city that the stores will not deliver, which means the maintenance of a horse and wagon, as well as the hire of an extra man. Furthermore, the laundry bill should be reduced in 1914, owing to the laundry machinery that we are expecting to be installed early in the year.

During the year many improvements have been made, the expense of which came out of the appropriation for current expenses. This has been possible through the men regularly employed here, which saved the cost of labor.

On the grounds the following has been done:

About 2,000 cubic feet of grading.

One thousand two hundred square feet cement walks laid.

Two hundred and twenty-five linear feet cement curbing laid.

Two thousand bushels of ashes put on roads.

Cultivation of lawn grass and clover on plots immediately surrounding buildings.

Over 100 shade trees and bushes were planted.

Two large electric lights were installed in front of the Hospital and Administration Building.

Two hundred and fifty feet of terra-cotta piping to drain water from the tank and fire plug.

ADMINISTRATION BUILDING.

This building was practically renovated the latter part of 1912, papered, painted, new linoleum, etc. This year the only additions were new filing cases and cabinets.

HOSPITAL.

New gas machine mixer.

Corridors plastered and papered.

Diet kitchen and bathrooms painted.

New instruments, including operating table, microscope, etc.

Ice box (capacity one ton) was built.

New radiators for ward facing the northwest.

LAUNDRY BUILDING.

Painted inside and out.

Basement and one-half of first floor reconstructed for laundry machinery with 8 x 8 scantling on concrete pillars. Ceiling reinforced with double joists. Metal ceiling replaced plastering.

GARAGE AND STABLE.

Painted; concrete floors; new shower bath, lavatory and toilet for the men; new doors; shed for implements; new heating and water lines; new horse and cart; inclosure of garage; underground tank for gasoline.

The new home for the Superintendent was completed the latter part of December, which is an attractive addition to the group of buildings. It contains four bedrooms, one living-room, dining-room, kitchen and pantry. There is also a partial excavation for a cellar.

Plans are ready for the erection of a miscellaneous and detention ward with 20 separate rooms. This building was appropriated for three years ago; at that time, however, for a measles ward. A glance at the report of the Resident Physician will convince one of the wisdom of this substitution and the very urgent need of a building as is planned.

For the coming year the following additions are necessary, using the present year as an index:

First—Suitable quarters for nurses. At the present time the accommodations for nurses are far too inadequate, and in the event that the new building is erected without first providing for more nurses, the doors will be closed until this problem is met. There is not even room enough for nurses to operate the present ward when there is a big demand for admission to the Hospital. At present they contemplate using the new home for the Superintendent.

Second—Detention ward. Observation rooms. This building which has already been mentioned should be erected just as soon as the weather permits. It is hard to express on paper the crying need for such a building.

Third—Provision for the care of colored patients suffering with infectious diseases.

Fourth—Morgue and chapel.

Fifth—Removal of the telephone and telegraph poles.

Sixth—Storeroom for supplies.

Seventh—The installation of bath tubs in place of the shower baths. Shower baths are not suitable for a hospital in which children mostly are treated.

Among minor needs the following repairs and additions are necessary for the upkeep of the buildings and the grounds:

Radiators in sun parlor.
Tank painted.
Incinerator rebuilt.
New floors in laundry building.
Steps for Administration Building.
Signs to guide visitors and warn intruders.
Grounds around new cottage put in shape.

The broadening of the work of the Hospital must be thought of as the present capacity (maximum) is only thirty-five beds. However, this is out of my province, as it would mean the expenditure of a large sum of money.

In conclusion, I wish to thank my assistants, the nursing staff and employes, whose co-operation have made possible such results as we have had.

S. T. NICHOLSON, JR., *Superintendent.*

REPORT OF RESIDENT PHYSICIAN.

The complete medical summary will be found in the "Detailed Medical Report," which is tabulated. I wish here to call attention to a few incidents that occurred during the year. On February 2 we had measles to break out in the scarlet fever wards. This spread so rapidly that it was deemed advisable to close the Hospital to all patients until the cross infection was under control. No patient was admitted during the month of March. Notwithstanding the fact that there were no admissions in this month, the total number of patients admitted greatly exceeded the record of former years. I am glad to report that there were no deaths resulting from the cross infection.

Three suspects were admitted. They turned out to be the following, viz.: one case of epidemic meningitis, one case of gumma of the soft palate, one case of mucous patches on the tonsils. Negative cultures from the nose and throat, as well as failures on the part of the patients to respond to antidiphtheritic treatment, resulted in their early discharge.

There were some refusals of cases in which the diagnosis was doubtful, due to the fact that there is no observation ward and the manifest unfairness to the patients already here and the ones to be admitted.

The mortality record is gratifying, excluding the deaths that occurred within 24 hours after admission. Out of a total of 10 deaths, due to diphtheria, six died within 24 hours.

It has been our method to open the ear drums when the first signs of inflammation appeared. Whether this is responsible or not for the prevention of mastoiditis, I can not say, although 136 cases of scarlet fever were admitted, not a single case of mastoiditis developed. One mastoid operation was done during the year and that was admitted as such in the sixth week of the disease.

Our plea is for a greater capacity for patients and the early admission of same.

The Hospital is greatly indebted to the consulting staff, Drs. Davis and Shipley, on whom numerous calls have been made and have always been answered cheerfully and promptly. I take this opportunity to express my gratitude to them, also Dr. Hogan, the Assistant Physician, whose aid and co-operation has been invaluable.

S. T. NICHOLSON, JR., M. D.,
Resident Physician.

ANNUAL REPORT

OF THE

TUBERCULOSIS DIVISION

Report of the Tuberculosis Division.

BALTIMORE, January 1, 1914.

NATHAN R. GORTER, M. D.,
Commissioner of Health.

DEAR SIR:

December 31, 1913, marked the close of the fourth year's work of the Tuberculosis Division of the Health Department. It is the object of this Division to bring under its supervision all cases of pulmonary tuberculosis who are living in the City of Baltimore, whether they are early or advanced, chronic or suspicious, active or arrested, of all classes, races and creeds, to give them nursing care when necessary, to distribute to them the prophylactic supplies provided by the State Board of Health; to arrange for them to enter sanatoria and hospitals; to advise them in regard to living and working conditions; and to bring them into contact with the proper people and agencies needed to accomplish the necessary changes in their environment, when they cannot arrange for them unaided.

The city is divided into sixteen districts, one nurse being detailed to each district, and the work supervised by the superintendent of the division. All the nurses are registered nurses and receive $75 per month and a reasonable amount of money for car fare and telephone messages. They are allowed two weeks' sick leave with pay and two weeks' vacation during the summer each year. This vacation is entirely too short to allow the nurses to recuperate sufficiently, mentally and physically, to bring back enough vitality and enthusiasm for another 11½ months' successful work. Baltimore at present is the only city of its size, if not the only city, that does not give a longer vacation to its nurses.

The nurses wear blue denim uniforms in winter and blue chambray ones in summer, and plain collars, coats, and hats which are not uniform. Each is furnished with a black leather bag in which to carry the prophylactic supplies. They report to the main office at 8.30 A. M. daily. Here they give an account of the work of the preceding day to the Superintendent, enter a record of it upon the patients' charts, stock their bags, and receive instructions for the day. At noon they spend an hour in their district offices for lunch, to meet patients and to restock their bags. There are eight district offices situated on the border lines of several districts. When their work allows, they leave the district at 4 P. M. There is about an hour's clerical work to do at home.

Tuberculosis Dispensaries.

In addition to their visiting, the nurses are on duty at stated times in the various tuberculosis dispensaries of the city, and they instruct their patients to come to these dispensaries for diagnosis and treatment when they are on duty. It has been found that the patients come to the dispensaries much more readily when they know the nurse with whom they have become acquainted will be there. The nurses in this way get the instructions from the physicians directly and at once, and thus the danger of misunderstanding them and of any delay in carrying them out is avoided. The nurses too become familiar with all the new ideas and methods as they develop.

We now have five tuberculosis dispensaries—one at the University of Maryland, open at noon three times a week; the Phipps Tuberculosis Dispensary at Johns Hopkins Hospital, open every morning, and our own three Health Department Tuberculosis Dispensaries in three different sections of the city, each one open two half-days a week—one at 602 South Bond street, one at 1418 Light street, and the third (opened in April, 1913) in the Neighborhood House at 1220 McCulloh street. Through this one we hope to reach the large negro population of this section. Our dispensaries are in charge of Dr. John E. O'Neill. We greatly need another physician, not only as an assistant at the two dispensaries, which have become too heavy for one man to handle, but to visit our patients in their homes. At present when patients become too ill to go to the dispensary, no matter how faithful they have been in their attendance there, we have great difficulty in getting medical care for them. There is no hospital accommodation for them, they are too far advanced to go to the sanatoria, and none of the tuberculosis dispensaries provide a visiting medical service. Not only for their own sake, but for the sake of those who come in contact with them during this very infectious stage, there is great need for expert medical supervision. Dr. O'Neill has been most obliging in visiting these patients for us, but it is difficult for him to do so for his time is fully occupied, and in spite of his willingness it is impossible for him to answer all the calls. The patients become very much attached to and have great confidence in the doctors they have been accustomed to in the dispensaries, and naturally want these same physicians when at home. These physicians know these cases well, and the confidence they have inspired would have great weight in getting the patients to carry out the orders, which it is so necessary to follow, to check the spread of the disease.

Patients.

Number of patients under supervision, January 1, 1913		3,107
Old patients returned to visiting list		101
New patients during the year		1,777
Total		4.985
Number of patients died during the year	867	
Number that left the city	356	
Lost (address unknown)	210	
Not tuberculous	152	
Total		1,585
Patients under supervision, December 31, 1913		3,400

3,400 patients are under the care of 16 nurses—an average of 212½ patients per nurse—entirely too many for any one nurse to handle well, though eight nurses are carrying more than this number, and one nurse has 270 patients.

NURSING STAFF.

While only 9 per cent. of these patients are ill in bed at home and require nursing care, it takes as long, and more frequently longer, to persuade a patient to change his manner of living, than to give a bed-bath or the most difficult nursing treatment required. A person who has slept with windows closed all his life and is afraid of the night air cannot be persuaded to have them open in a five-minute visit once a month; nor can another one who does not feel a bit sick, but is tired and has had a cold, be persuaded in the same length of time to believe that he is sick enough to require his giving up work and going to a sanatorium for six months, while his wife and children must bear the burden of his loss of wages; or while the husband and children must do without the care of the wife and mother. If visiting tuberculosis nursing is to be an educational campaign the staff must be doubled, for no nurse can give effective instruction and do constructive work with the present number of patients under her care. This work should not be done without supervision any more than hospital ward work should be done by individual nurses without a head nurse. This is not a reflection on any individual nurse, but it is impossible for any new nurse to be given 200 new patients, a new section of the city, and an entirely new field of nursing and expect her to do this well without instruction and supervision. To keep nurses who have been doing work for many years from getting into routine habits of treating all cases also requires supervision, and.

even with them, new problems are continually coming up which should be referred to a supervisor who is as intimately acquainted with the case as the nurse herself.

One supervising nurse cannot organize and direct the work of the entire staff of 16 nurses, and surely not a staff of double that number, do her own clerical work, write all the reports, represent the work at all places where it should be represented, be in the office all day to answer all inquiries and to give out supplies, and visit 3,400 patients sufficiently often to know them intimately enough to give the best and wisest decision and advice in each case.

There should be a visiting nurse to every 100 patients, and for every 10 or 15 visiting nurses an assistant supervising nurse, whose main duty should be to visit the patients under her often enough to be able to advise the nurse in each case and to know at once when a nurse has made a mistake or is unsuitable for the work. With a staff of this sort, some good results in educational work could be accomplished. At present our patients return from the sanatoria, where they have been watched and supervised constantly and visited by a doctor or nurse once a day at least, to the same surroundings and influences which they left and which were more or less responsible for their break-down, to be visited by a nurse only once a month or once in six weeks—for these are the patients who need us least. They make a successful stand for their newly acquired habits for a while, but without the constant encouragement, which frequent visits from the nurse give, they sooner or later succumb to the habits and influences of a lifetime. A paramount question today is: What is to be done with and for the ex-sanatorium patient? The answer should be: Give him sufficient supervision by a visiting tuberculosis nurse to help him establish in his old surroundings his new habits and mode of life. This cannot be done in Baltimore by 16 nurses and one supervising nurse for 3,400 patients, a number which is daily increasing.

The expense of this should not be borne entirely by the Health Department. We visit practically all the ex-patients from the Municipal Tuberculosis Hospital, the Jewish Home for Consumptives, Eudowood, and the State Sanatorium, and do all we can for them. We also send Eudowood and the State Sanatorium reports of these patients from time to time, for which, if they collected the information themselves, they would require a force as large as ours at least. This is also true of the State Board of Health. Their files would be so much dead timber without the information we are constantly giving them. It is true that all this extends the field of our work, but it is also true that the information we send to these institutions is valuable to them and requires much clerical work, as well as many visits to patients, from the members of our staff. It would require a considerable outlay on their part to do this without our assistance. It would be foolish for each of these to have a separate set of nurses visiting the same homes with us. It would take up the patients' time unnecessarily, and no new information would be gained. The lack of co-operation would undoubtedly result in misunderstandings which would be detrimental to the work in general. But could not some arrangement be made, as there has been in the case of our own tuberculosis dispensary nurses, for each institution to become responsible for the salaries of a certain number of nurses and a supervising nurse, these to be added to our staff, and the city divided into that many more districts? In this way, instead of several sets of nurses visiting the same people, each having too many patients to care for properly and consequently being able to do only very superficial work with very unsatisfactory results, the work of each nurse would be reduced to a manageable size, and the results obtained for each institution would be far more satisfactory and more nearly accurate, at a smaller expense than if each undertook to employ separately the necessary force to do the work well.

VISITS.

The nurses have made 79,289 visits during the year:

Visits to patients	69,743
Co-operative visits	3,075
Visits to arrange for fumigation	3,327
Visits to inspect after fumigation	3,144

This is an average of 20½ visits per day, and this allows only 14½ minutes to travel from patient to patient, as well as for a visit.

SOCIAL CONDITION OF PATIENTS.

Of the 3,400 patients on our list January 1, 1914, only 618, or 18 per cent., were known to any charitable institution:

Federated Charities	475
Hebrew Benevolent Society	76
St. Vincent de Paul	67
Total	618

White native Americans	2,191
Jews	393
Foreigners	326
Negroes	490
Total	3,400

Only 96, or 2⅞ per cent., object to the nurses' visits.

PHYSICAL CONDITION.

672 patients have not been diagnosed as positive cases of pulmonary tuberculosis, but are sufficiently suspicious to require a nurse to visit them until a more definite diagnosis can

3,400 patients are under the care of 16 nurses—an average of 212½ patients per nurse—entirely too many for any one nurse to handle well, though eight nurses are carrying more than this number, and one nurse has 270 patients.

NURSING STAFF.

While only 9 per cent. of these patients are ill in bed at home and require nursing care, it takes as long, and more frequently longer, to persuade a patient to change his manner of living, than to give a bed-bath or the most difficult nursing treatment required. A person who has slept with windows closed all his life and is afraid of the night air cannot be persuaded to have them open in a five-minute visit once a month; nor can another one who does not feel a bit sick, but is tired and has had a cold, be persuaded in the same length of time to believe that he is sick enough to require his giving up work and going to a sanatorium for six months, while his wife and children must bear the burden of his loss of wages; or while the husband and children must do without the care of the wife and mother. If visiting tuberculosis nursing is to be an educational campaign the staff must be doubled, for no nurse can give effective instruction and do constructive work with the present number of patients under her care. This work should not be done without supervision any more than hospital ward work should be done by individual nurses without a head nurse. This is not a reflection on any individual nurse, but it is impossible for any new nurse to be given 200 new patients, a new section of the city, and an entirely new field of nursing and expect her to do this well without instruction and supervision. To keep nurses who have been doing work for many years from getting into routine habits of treating all cases also requires supervision, and.

There should be a visiting nurse to every 100 patients, and for every 10 or 15 visiting nurses an assistant supervising nurse, whose main duty should be to visit the patients under her often enough to be able to advise the nurse in each case and to know at once when a nurse has made a mistake or is unsuitable for the work. With a staff of this sort, some good results in educational work could be accomplished. At present our patients return from the sanatoria, where they have been watched and supervised constantly and visited by a doctor or nurse once a day at least, to the same surroundings and influences which they left and which were more or less responsible for their break-down, to be visited by a nurse only once a month or once in six weeks—for these are the patients who need us least. They make a successful stand for their newly acquired habits for a while, but without the constant encouragement, which frequent visits from the nurse give, they sooner or later succumb to the habits and influences of a lifetime. A paramount question today is: What is to be done with and for the ex-sanatorium patient? The answer should be: Give him sufficient supervision by a visiting tuberculosis nurse to help him establish in his old surroundings his new habits and mode of life. This cannot be done in Baltimore by 16 nurses and one supervising nurse for 3,400 patients, a number which is daily increasing.

The expense of this should not be borne entirely by the Health Department. We visit practically all the ex-patients from the Municipal Tuberculosis Hospital, the Jewish Home for Consumptives, Eudowood, and the State Sanatorium, and do all we can for them. We also send Eudowood and the State Sanatorium reports of these patients from time to time, for which, if they collected the information themselves, they would require a force as large as ours at least. This is also true of the State Board of Health. Their files would be so much dead timber without the information we are constantly giving them. It is true that all this extends the field of our work, but it is also true that the information we send to these institutions is valuable to them and requires much clerical work, as well as many visits to patients, from the members of our staff. It would require a considerable outlay on their part to do this without our assistance. It would be foolish for each of these to have a separate set of nurses visiting the same homes with us. It would take up the patients' time unnecessarily, and no new information would be gained. The lack of co-operation would undoubtedly result in misunderstandings which would be detrimental to the work in general. But could not some arrangement be made, as there has been in the case of our own tuberculosis dispensary nurses, for each institution to become responsible for the salaries of a certain number of nurses and a supervising nurse, these to be added to our staff, and the city divided into that many more districts? In this way, instead of several sets of nurses visiting the same people, each having too many patients to care for properly and consequently being able to do only very superficial work with very unsatisfactory results, the work of each nurse would be reduced to a manageable size, and the results obtained for each institution would be far more satisfactory and more nearly accurate, at a smaller expense than if each undertook to employ separately the necessary force to do the work well.

VISITS.

The nurses have made 79,289 visits during the year:

Visits to patients	69,743
Co-operative visits	3,075
Visits to arrange for fumigation	3,327
Visits to inspect after fumigation	3,144

This is an average of 20½ visits per day, and this allows only 14½ minutes to travel from patient to patient, as well as for a visit.

SOCIAL CONDITION OF PATIENTS.

Of the 3,400 patients on our list January 1, 1914, only 618, or 18 per cent., were known to any charitable institution:

Federated Charities	475
Hebrew Benevolent Society	76
St. Vincent de Paul	67
Total	618

White native Americans	2,191
Jews	393
Foreigners	326
Negroes	490
Total	3,400

Only 96, or 2⅞ per cent., object to the nurses' visits.

PHYSICAL CONDITION.

672 patients have not been diagnosed as positive cases of pulmonary tuberculosis, but are sufficiently suspicious to require a nurse to visit them until a more definite diagnosis can

be made. Of the 2,728 positive cases—435 are early cases; 352 are chronic cases; 662 seem to be arrested.

Active cases		2,066
Adequately careful (all but 10 in sanatoria)	359	
Moderately careful	1,011	
Careless	696	
In institutions		349
At home		3,051
Able to work	1,946	
Able to work part time	666	
Unable to work, but not confined to bed	319	
Confined to bed	120	

All of the 120 who are confined to bed should be in hospitals, as each one in this stage of the disease is a great source of infection to those at home. If there were hospital accommodations sufficiently close to their homes to allow frequent visits from the families, there would be no more difficulty in getting these patients to go to hospitals when ill from this disease than when ill from any other cause. The well organized hospital has been established so long that the people very generally realize the comfort and care it gives to its patients. A well equipped and well managed ward for tuberculous patients in each hospital would not be nearly the source of danger that cases of pulmonary tuberculosis, unknown as such, are in surgical and medical wards. Frequent deaths from tuberculosis in all hospitals in the city show that the need for other treatment brings many people with this disease to them. It would also be a splendid opportunity for the medical students who are going out into general practice and the nurses who will engage in private duty nursing to be instructed in the proper care of these patients for whom they will so frequently be responsible later, not only as individual patients, but as members of a family and community whom they may possibly infect. Will they not be better able to assume this responsibility if trained in the proper methods of isolation and will they not be in less danger of personal infection in such wards safeguarded by knowing the disease for which they are caring, than as at present caring for patients with tuberculosis to which no attention is called because another condition is more important for the time being?

The 319 who are unable to work, but are not bed-ridden, and many, if not all, of the 666 who can work only part of the time, should be in sanatoria where they could be carefully watched, their work supervised, and their minds free from the worry which contact with the duties they should be doing, but are unable to do, is sure to bring. This cannot be done as long as the number of sanatorium beds does not meet the demand, and as a result the patients must leave at the end of six months, whether their condition warrants such a course or not.

Home Occupation of Patients Needing Sanatorium Care.

Among 101 patients needing sanatorium care January 1, 1914, for whom there was no accommodation, owing to insufficient provision for white patients and the lack of provision for negroes, 60 active open cases were by their own occupations brought into close personal contact with the domestic and social life of other residents of Baltimore, and 126 other people living in the same houses with them were brought into similar contact. This latter number we have not been able to have diagnosed, but it seems reasonable to suppose that in homes where the family income is so low that even the sick must work—that there is not sufficient nourishment, sufficient room for proper sleeping and living arrangements, nor that freedom from worry necessary to build up a resistance to this disease to prevent these contact cases from developing it, and sooner or later breaking down from it. The following table shows the occupation according to races:

Occupation According to Races.

Color.	Pa-tients.		Con-tacts.		Laundry at Home.	Laundry in Others' Homes.	Housework by the Day.	Sewing at Home.	Sewing in Others' Homes.	Nurse Maid.
	Total.		Total.							
White…	101	37	…	…	3	1	4	8	…	…
Black…	…	64	…	…	13	2	11	1	…	2
White…	…	…	126	33	5	1	3	13	5	…
Black…	…	…	…	93	36	16	19	1	1	4

Color.	Domestic Cook.	Domestic Waitress.	Butler.	Domestic Chambermaid.	General Maid.	Hotel Dishwasher.	Hotel Waiter.	Hotel Waitress.	Hotel Chambermaid.	Bartender.	Oyster Shucker.
White…	1	1	…	…	1	…	…	…	…	…	…
Black…	1	…	…	…	5	…	3	…	…	1	1

Color.	Candymaker.	Boarding-house.	Drug Packer.	Charwoman.	School Janitor.	Total.	Laundry at Home and in Others' Homes.	Laundry at Home and Housework by the Day.	Laundry at Home and School Janitor.	Laundry and Sewing at Home.	Total.
White…	…	…	1	…	…	20	…	1	…	…	1
Black…	…	…	…	…	…	40	1	…	…	…	1
White…	1	1	…	1	…	33	…	…	…	…	…
Black…	…	…	…	…	1	106	10	1	1	1	13

While only one-seventh of all our patients are negroes, two-thirds of the number of open cases employed in homes or in personal service of some kind and three-fourths of the contact cases belong to this race.

For all the negro patients of Baltimore there are just 45 beds and these are in the Municipal Tuberculosis Hospital at Bay View. We have 496 beds for white patients, or 11 times as many, though the ratio between the two races in population is 1 to 7—the same as it is among our patients. For those who do not care whether the tuberculosis death rate is lowered, a study of the occupations of these negroes who have active cases of pulmonary tuberculosis may be interesting—nurse maids, cooks, laundresses, oyster shuckers, bartenders, and candymakers—and the fact that most of them are working because there are no hospital accommodations for them, and that most of the white ones are working because there is not a sufficient number of beds to allow them to stay until they become arrested cases may stir up an interest in and a support of a movement to get beds for these people.

EX-SANATORIUM PATIENTS.

Of the 3,051 patients at home, 1,173 have had sanatorium care—1,064 in one sanatorium, 97 in two sanatoria, and 12 in three sanatoria. All of them should have had this care at some time, but this is impossible with the present number of beds and many more than 97 have been in need of treatment for a longer time than could be allowed, and would have been benefited by an opportunity to undergo this treatment a second or third time.

PROPHYLACTIC SUPPLIES.

The following prophylactic supplies, provided by the State Board of Health, have been distributed by the nurses during the year:

	No.	Cost
Paper napkins	795,000	$492 90
Fillers	100,000	350 00
Disinfectant (bottles)	6,229	622 90
Tin cups	1,380	96 60
Waterproof pockets	650	26 00
Books of information	2,700	135 00
Total		$1,723 40

SOURCES FROM WHICH PATIENTS HAVE BEEN OBTAINED.

We have received our patients from many sources. The increase yearly in the number of patients reported to us by the physicians of Baltimore is very gratifying indeed, as it means that the nurses' work has won their co-operation and support, but it is not enough. During the four years that this Division has existed there has been an average of only one case reported yearly by every three doctors, while the average number of cases found yearly by each nurse, and diagnosed as pulmonary tuberculosis by the physician to whom they have been taken for examination, is 26.

Found by nurses	214
Reported by physicians	328
Patients, family, or friends	103
Instructive Visiting Nurse Association	75
Phipps Dispensary	406
Federated Charities	60
Maryland University Tuberculosis Dispensary	70
City Medical Agencies	27

Total	1,777

SPECIAL INVESTIGATIONS.

This Division has done two special pieces of work during the year—the investigation of a wholesale book and stationery store for the possible source of infection of several cases of pulmonary tuberculosis that had developed among its employes, and the preparation of an exhibit of the work of this Division since its organization, for the one of the Health Department given under the auspices of the Bureau of State and Municipal Research, at the City Club, November 13 to December 3, 1913.

In the former case the source of infection seemed to be outside of the place of employment, as all of the patients were closely related—some living in the same house, and no other employes had developed the disease. The investigation was undertaken at the request of the employers, who co-operated splendidly, and as a result changed their methods of cleaning the establishment to one which we considered more sanitary as well as more effectual.

The exhibit showed very markedly the increase in the work of this Division and the increase in its efficiency—for the increase in the personnel has been very much less than the increase in the amount of work done. The charts and tables compiled for it will be found at the end of the report.

RESULTS.

As a result of the nurses' work, 1,472 cases of pulmonary tuberculosis have been registered by them with the State Board of Health; 3,375 patients have been sent to dispensaries for diagnosis and treatment; and 770 have been sent to the various tuberculosis hospitals and sanatoria:

Municipal Hospital	298
State Sanatorium	295
Eudowood Sanatorium	116
Jewish Home for Consumptives	61
Total	770

One hundred and twenty-eight nuisances have been reported for abatement.

DIET.

We have asked for diet in only 23 cases:

Federated Charities	20
Hebrew Benevolent Society	3

All these requests have been for white patients:

Patients on the waiting list for sanatoria		11
Municipal Tuberculosis Hospital	5	
State Sanatorium	1	
Eudowood	4	
Jewish Home for Consumptives	1	
Special diet ordered by physician		1
Extra food ordered by physician		9
Patients awaiting diagnosis		2
Total		23

FUMIGATION.

There have been 3,293 houses inspected to arrange for fumigation. Of these it was found that it would be unnecessary to fumigate 130.

Investigations for fumigation after death, 1,107; not necessary.... 44

Fumigation investigation after removal:

To Bay View Hospital	410		"	"	60	
To State Sanatorium	460		"	"	12	
To Eudowood	132		"	"	10	
To Jewish Home for Consump.	76		"	"	1	
To other quarters	1,108		"	"	3	
		2,186				86
Total		3,293				130

As a result of the nurses' instructions in these cases, the follow precautions were found to have been taken, when the nurses inspected following fumigation:

After Death—	
Houses cleaned	838
Houses not cleaned	141
Houses vacant	65
Total number inspected	1,044
Bedding, etc., burned	402
Bedding, etc., sterilized	379
Rooms, papered, etc.	59
After Removal—	
Houses cleaned	1,527
Houses not cleaned	270
Houses vacant	258
Total number inspected	2,055
Bedding, etc., burned	163
Bedding, etc., sterilized	213
Rooms papered, etc.	108

RECOMMENDATIONS.

The work is increasing yearly, and consequently the time allowed each patient for nursing care, instruction and advice grows less and less. How long will this continue? The staff should be increased at once. We need double the number of nurses at least; we need assistants to the Superintendent to supervise the field work; we need a clerical force to keep accurate and careful records—not only to know what work is being done, but to be able to tell the effect of this work so that we may know what is of value and what is useless. At present the nurses are devoting two hours a day to this clerical work. This means that much less time in which to visit patients. As the number of patients increases, the clerical work increases and consequently both need more time, and both suffer from the lack of it. Would it not be more economical, as well as better for the patients, to employ stenographers trained for statistical work, to whom the nurses could dictate their records in much less time than they now spend in writing them? These clerks accustomed to this sort of work could do it far better than the nurses and less expensively. The nurses would have more time in which to visit patients, which is work that they only can do. We need more hospital beds for advanced cases, close to their homes, and we need a tuberculosis specialist to assist in the dispensaries and to visit our patients in their homes when they become too ill to go to the dispensaries and cannot enter hospitals because there is no provision for them. With more nurses on the visiting staff the need for a larger number of sanatorium beds would be lessened, because with better supervision at home the patients could return home sooner with less danger of the poor results that so frequently occur through the sudden cessation of careful watching under present conditions. And we need more beds for negro patients.

Respectfully submitted,

ELEANOR A. McI. JONES, R. N.,
Acting Superintendent Tuberculosis Division

Report of the Municipal Tuberculosis Dispensaries.

BALTIMORE, March 28, 1914.

NATHAN R. GORTER, M. D.,
Commissioner of Health.

DEAR SIR:

In submitting the following report for the year 1913 it may, perhaps, be conducive to a more intelligent and appreciative reading of the results if a few words of explanation be added concerning them.

Of the 898 cases 199 positive diagnoses were made; 252 put on what is termed the suspicious list; the remaining 447 regarded as negative. In many clinics the classification is somewhat more comprehensive, but with the end in view of obtaining practical results it was thought wise when the dispensaries were inaugurated to establish the above classification. It is not to be assumed that the entire number of negative cases means that these persons have not tuberculosis. It simply means that as far as we are able to find out they are not suffering from clinical tuberculosis; are not infectious; are not a danger to others, and are not in need of treatment. The class "suspicious" in our work means that these are due to clinical history, physical examination or both combined. Perhaps such cases are regarded, if we may use the phrase, as being tuberculous, unless proven otherwise. In each of these suspicious cases we endeavor to impress upon them the necessity of returning for re-examination, and though it may take three or even four examinations, if they will but do what we ask they will eventually be taken from the suspicious class and, of course, be either positive or negative. A final word as to this classification: It has been established for the purpose of diagnosis alone, having in mind, of course, the necessity for treatment, menace to others, etc., for it is fairly well established that practically all adults have the process located somewhere in their tissues—in some instances not active, however.

The large proportion of colored patients at the McCulloh Street Dispensary is explained by the fact that it was the deliberate purpose of the Department to place this Dispensary in such a location as to enable it to seek that class of cases, which is perhaps the greatest menace of all (far advanced negroes).

The "old patients returned' include ex-sanatorium patients, some in whom the positive diagnosis was made but who, for various reasons, could not (or would not) take the cure away from home; some cases suffering from lung conditions other than tuberculosis, and not a few who have been placed on the list for the various institutions and are awaiting their turn. The prescriptions given are to all of these.

Of the 144 who were advised to undergo sanatorium treatment, 81 entered the various institutions. This is perhaps one of the most, if not *the* most, important result mentioned in this report. It will be seen that only slightly more than 50 per cent. took advantage of the opportunity offered to regain their health. This means that the remainder, for the most part at least, continued in the same surroundings, undoubtedly infecting many, many others, until they finally died. The reasons given by these patients for not leaving home are, of course, various, but in the opinion of the writer by far the most frequent in the case of the women is that they can not leave their children, and in the case of the men that they cannot leave their families without someone to provide for them. It is quite true that in many instances the charity organizations of the city come forward and care for these families whilst the sick member is away taking the cure.

Acknowledgement is here made of the wonderfully effective work being done by these organizations in that regard, but there are still a large portion of these cases who will not submit to any such arrangement. It may be mentioned that here perhaps is one place where our future efforts in the fight against tuberculosis are to be made. Indeed, in one of our large cities many of us will recall that there is home hospital treatment, this being an establishment of what is in reality a hospital and sanatorium combined, where not only the patient but the entire family is accepted, the patient, of course, treated appropriately and the other members of the family being shown how to live properly, particularly how to avoid this disease. The reports of this work show that it is not difficult at all to get these people, when once they believe they are sick, to move to what is only another part of their own city, the family remaining together, and the other members who are able to work still continuing their various avocations.

As to the sputum examinations made (115), it would seem to be, and is, really, a small number as compared to the total number examined, but a large proportion of the cases are of the far advanced class where the examination of the expectoration would be really superfluous—negative result not in our opinion having any great weight as to the existence or non-existence of the disease. In another group expectoration has been absent at times, but the clinical diagnosis is plain enough, and, as most of us know, it is when we are able to detect the lesion before it becomes an open one that we frequently get the best results by placing the patient at once under treatment. When the work becomes further developed we shall surely be able to get the bacteriological examinations of the sputum in all cases; this, of course, is to be desired.

A reference to the number of patients referred to the dispensaries will show that we are having the effective co-operation of the various charity organizations and general dispensaries.

The time perhaps is now ripe for the establishment of additional far advanced hospitals for both white and colored patients, and our work would seem to show that it is really the most urgent need at present, for it is hardly necessary to be reminded that this large number of advanced cases with active expectoration—the sputum teeming with bacilli—are the greatest sources of danger, it having been estimated that one of these cases can readily infect several hundred persons in one day. This is particularly true of those colored persons who in various ways come in contact with a number of healthy families by means of laundry work, etc.

It seems to us that more progress could probably be made if an additional physician could engage in the work, his time being spent mainly in two ways: first, by assisting at the Bond Street Dispensary, from which location we are turning away patients on every dispensary day; and secondly, by having him visit the large number of cases who cannot come to any dispensary, who have no regular physician, and who are, as it were, merely "hanging fire" no diagnosis ever having been made.

We take advantage of this opportunity to extend our sincere thanks to all those who by their encouragement, co-operation and personal efforts have made a success of this work. In particular we would say a word of appreciation for the remarkably effective work of the nurses. Their most difficult problems are, to our mind, hardly understood; for at all times it means a full day's work for one of these young ladies, using all the tact and persuasion possible, to get one case to the dispensary.

Very respectfully,

JOHN E. O'NEILL, M. D.,
Superintendent.

CHARTS

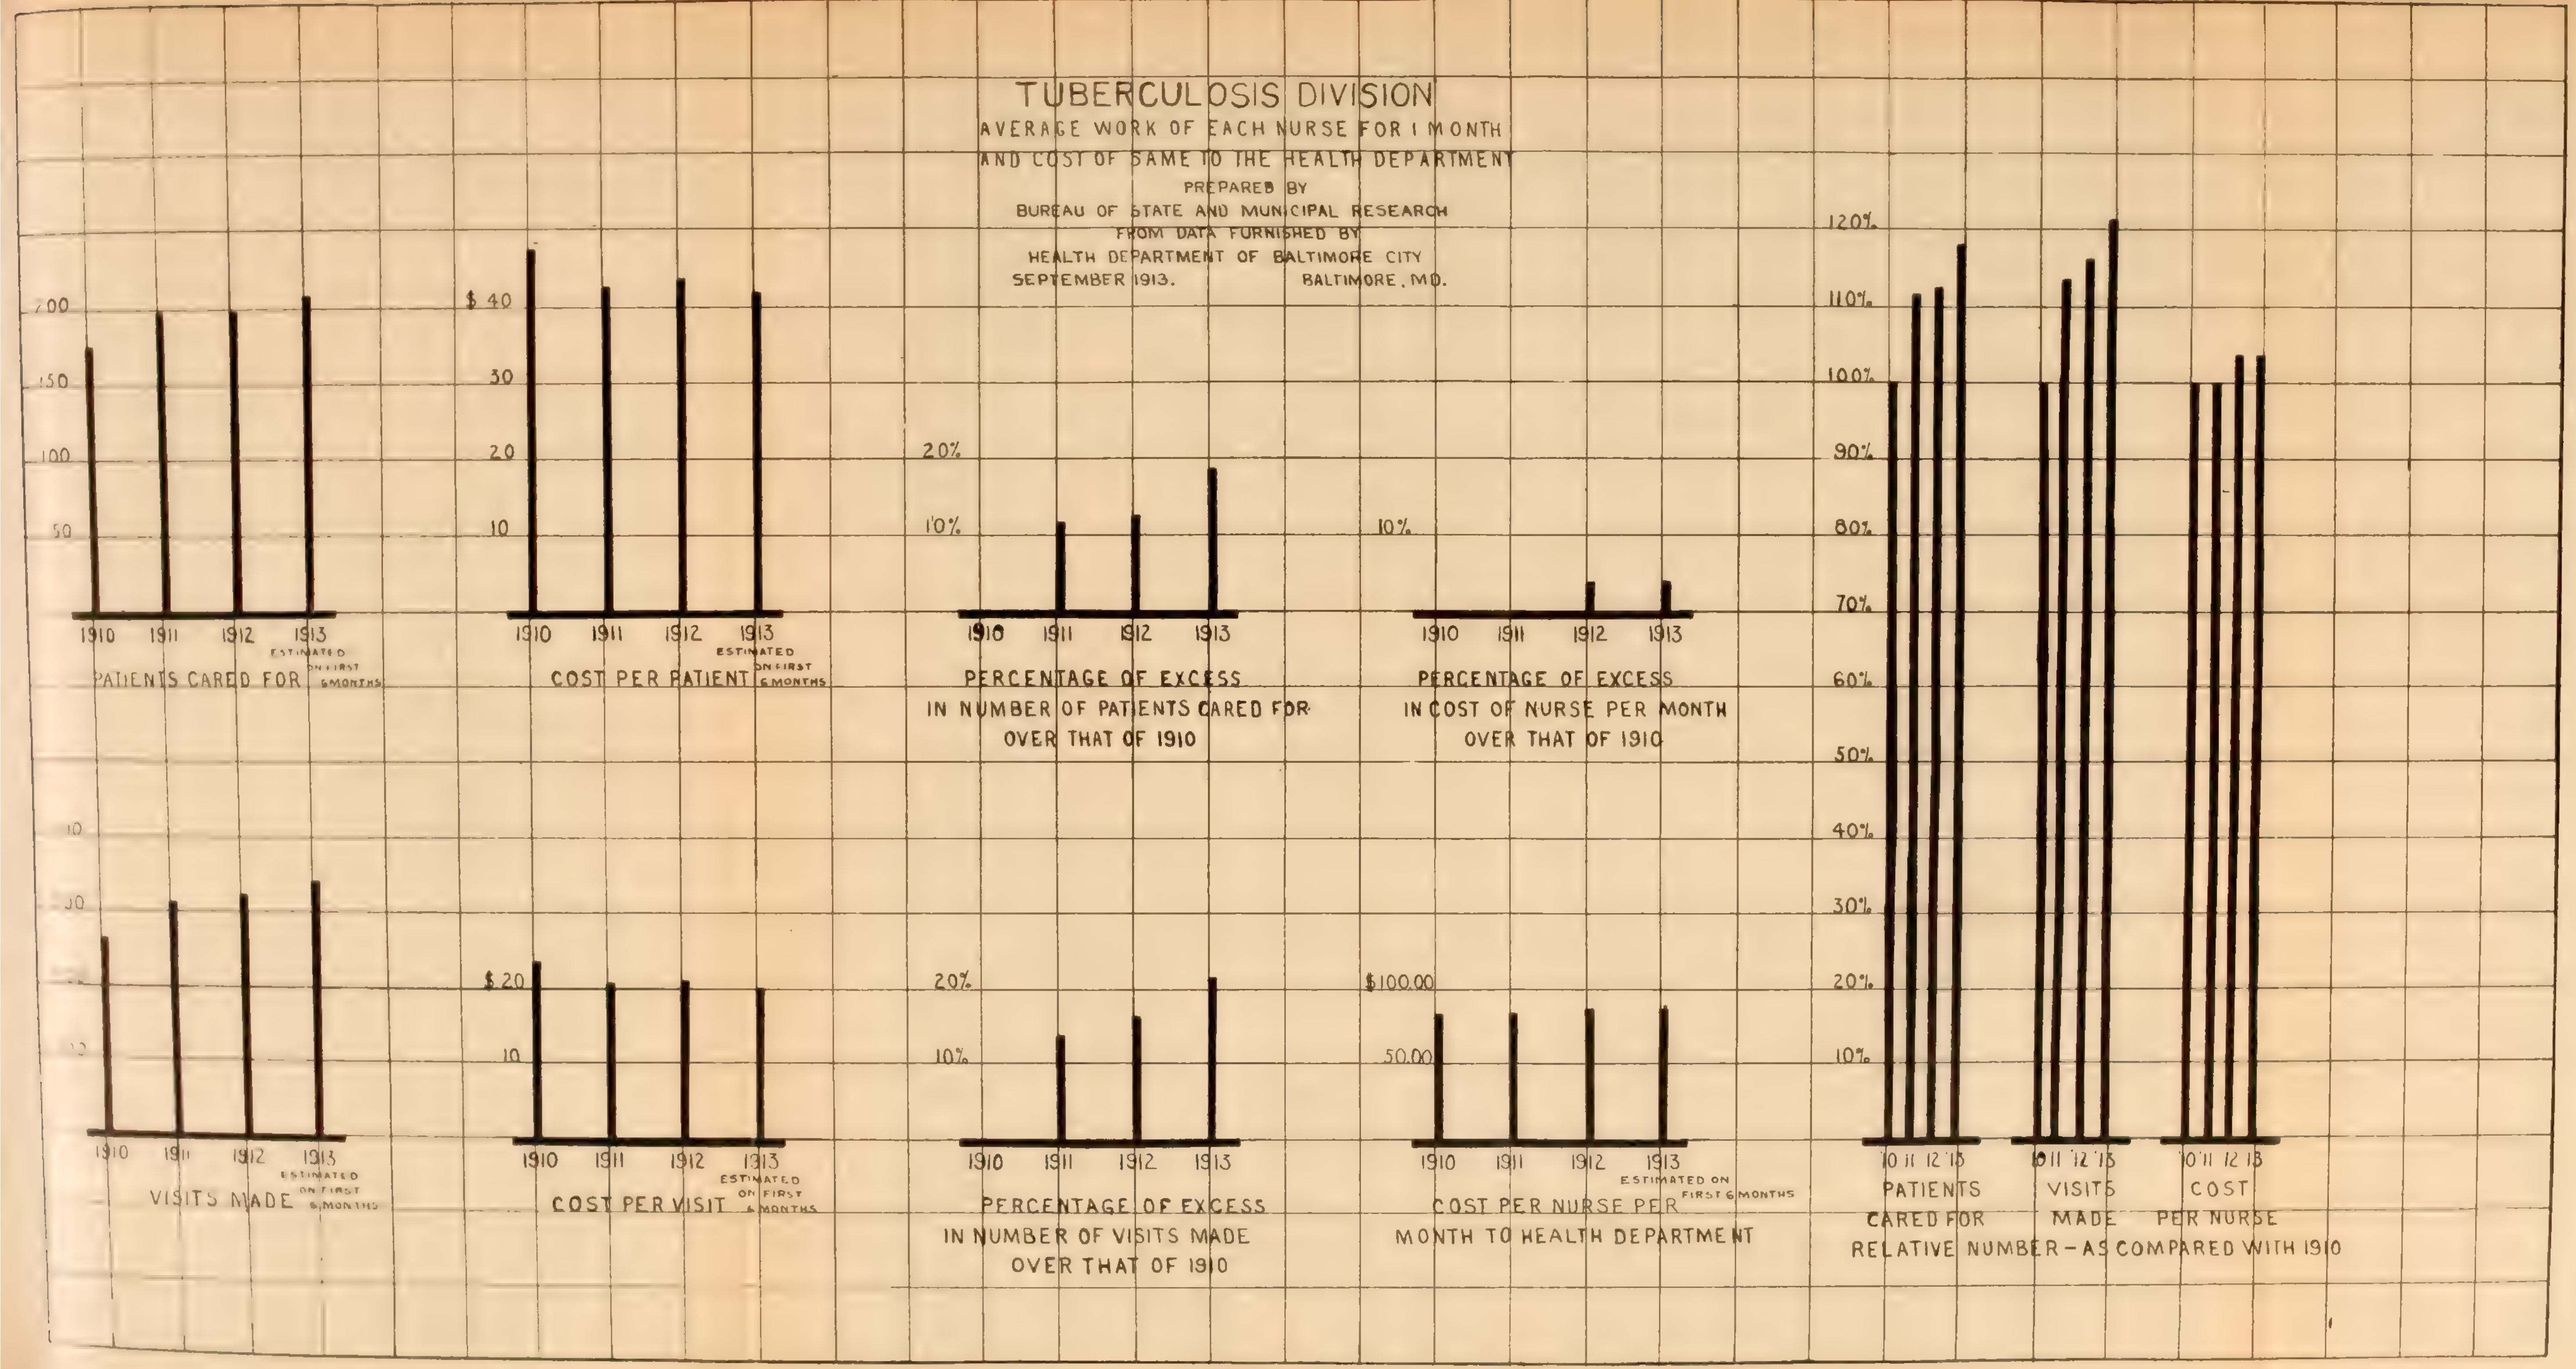
SHOWING THE WORK OF AND THE RESULTS ACCOMPLISHED BY THE

TUBERCULOSIS DIVISION

OF THE

HEALTH DEPARTMENT

FROM ITS ORGANIZATION, JANUARY, 1, 1910, TO JULY 1, 1913



TUBERCULOSIS DIVISION

OF THE

HEALTH DEPARTMENT.

NURSES' ROUTINE WORK

To VISIT all citizens of Baltimore who are suffering with pulmonary tuberculosis, unless consent is refused by the physician in charge. In these cases the patient is visited if a request is made by the patient or by a properly authorized, interested party.

To arrange for patients' ADMISSION TO A HOSPITAL OR SANATORIUM whenever possible when the disease is active—no matter whether it is incipient, moderately advanced, or advanced.

To give NURSING CARE to all who need it.

To ADVISE the patient and all living with him about the proper care of himself, his utensils and clothing, and the precautions it is necessary for the others to observe.

To DISTRIBUTE PROPHYLACTIC SUPPLIES.

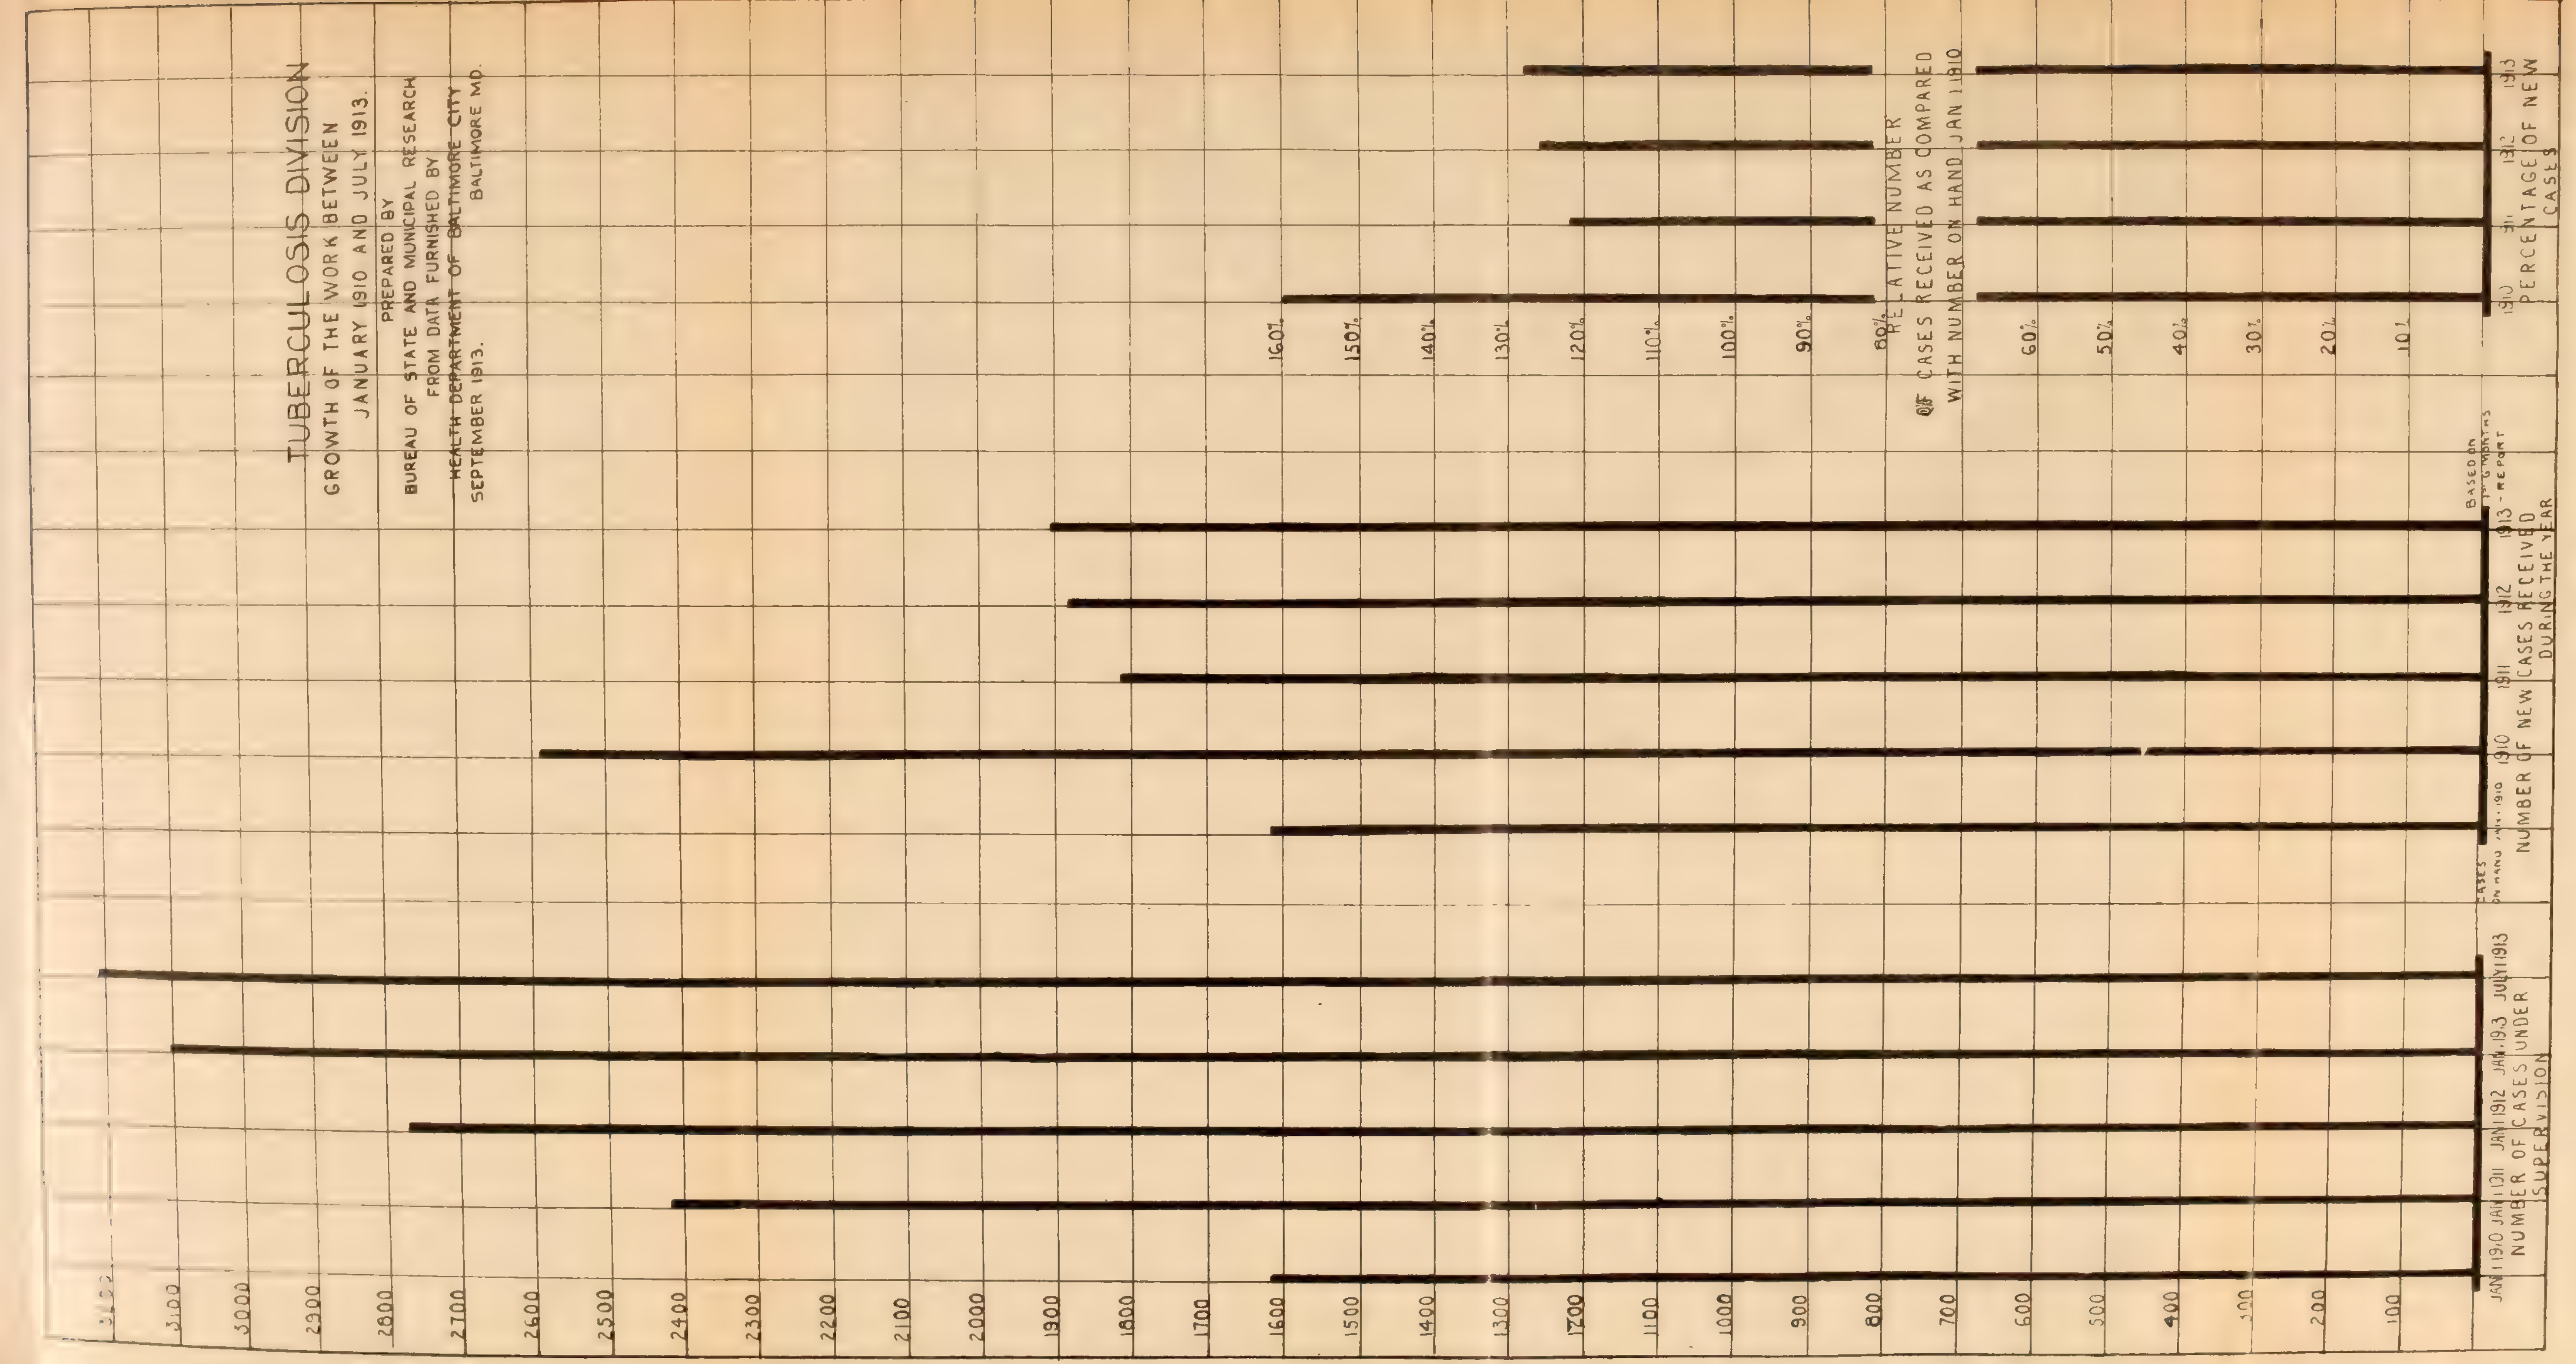
To arrange for all FUMIGATIONS after the patients have been removed to a sanatorium, hospital, or other quarters, or have died.

To urge the necessity and arrange for the STERILIZATION OR DESTRUCTION of all bedding, clothing, floor coverings and draperies used by patients during the active stage of the disease.

To INSPECT after all fumigations for tuberculosis.

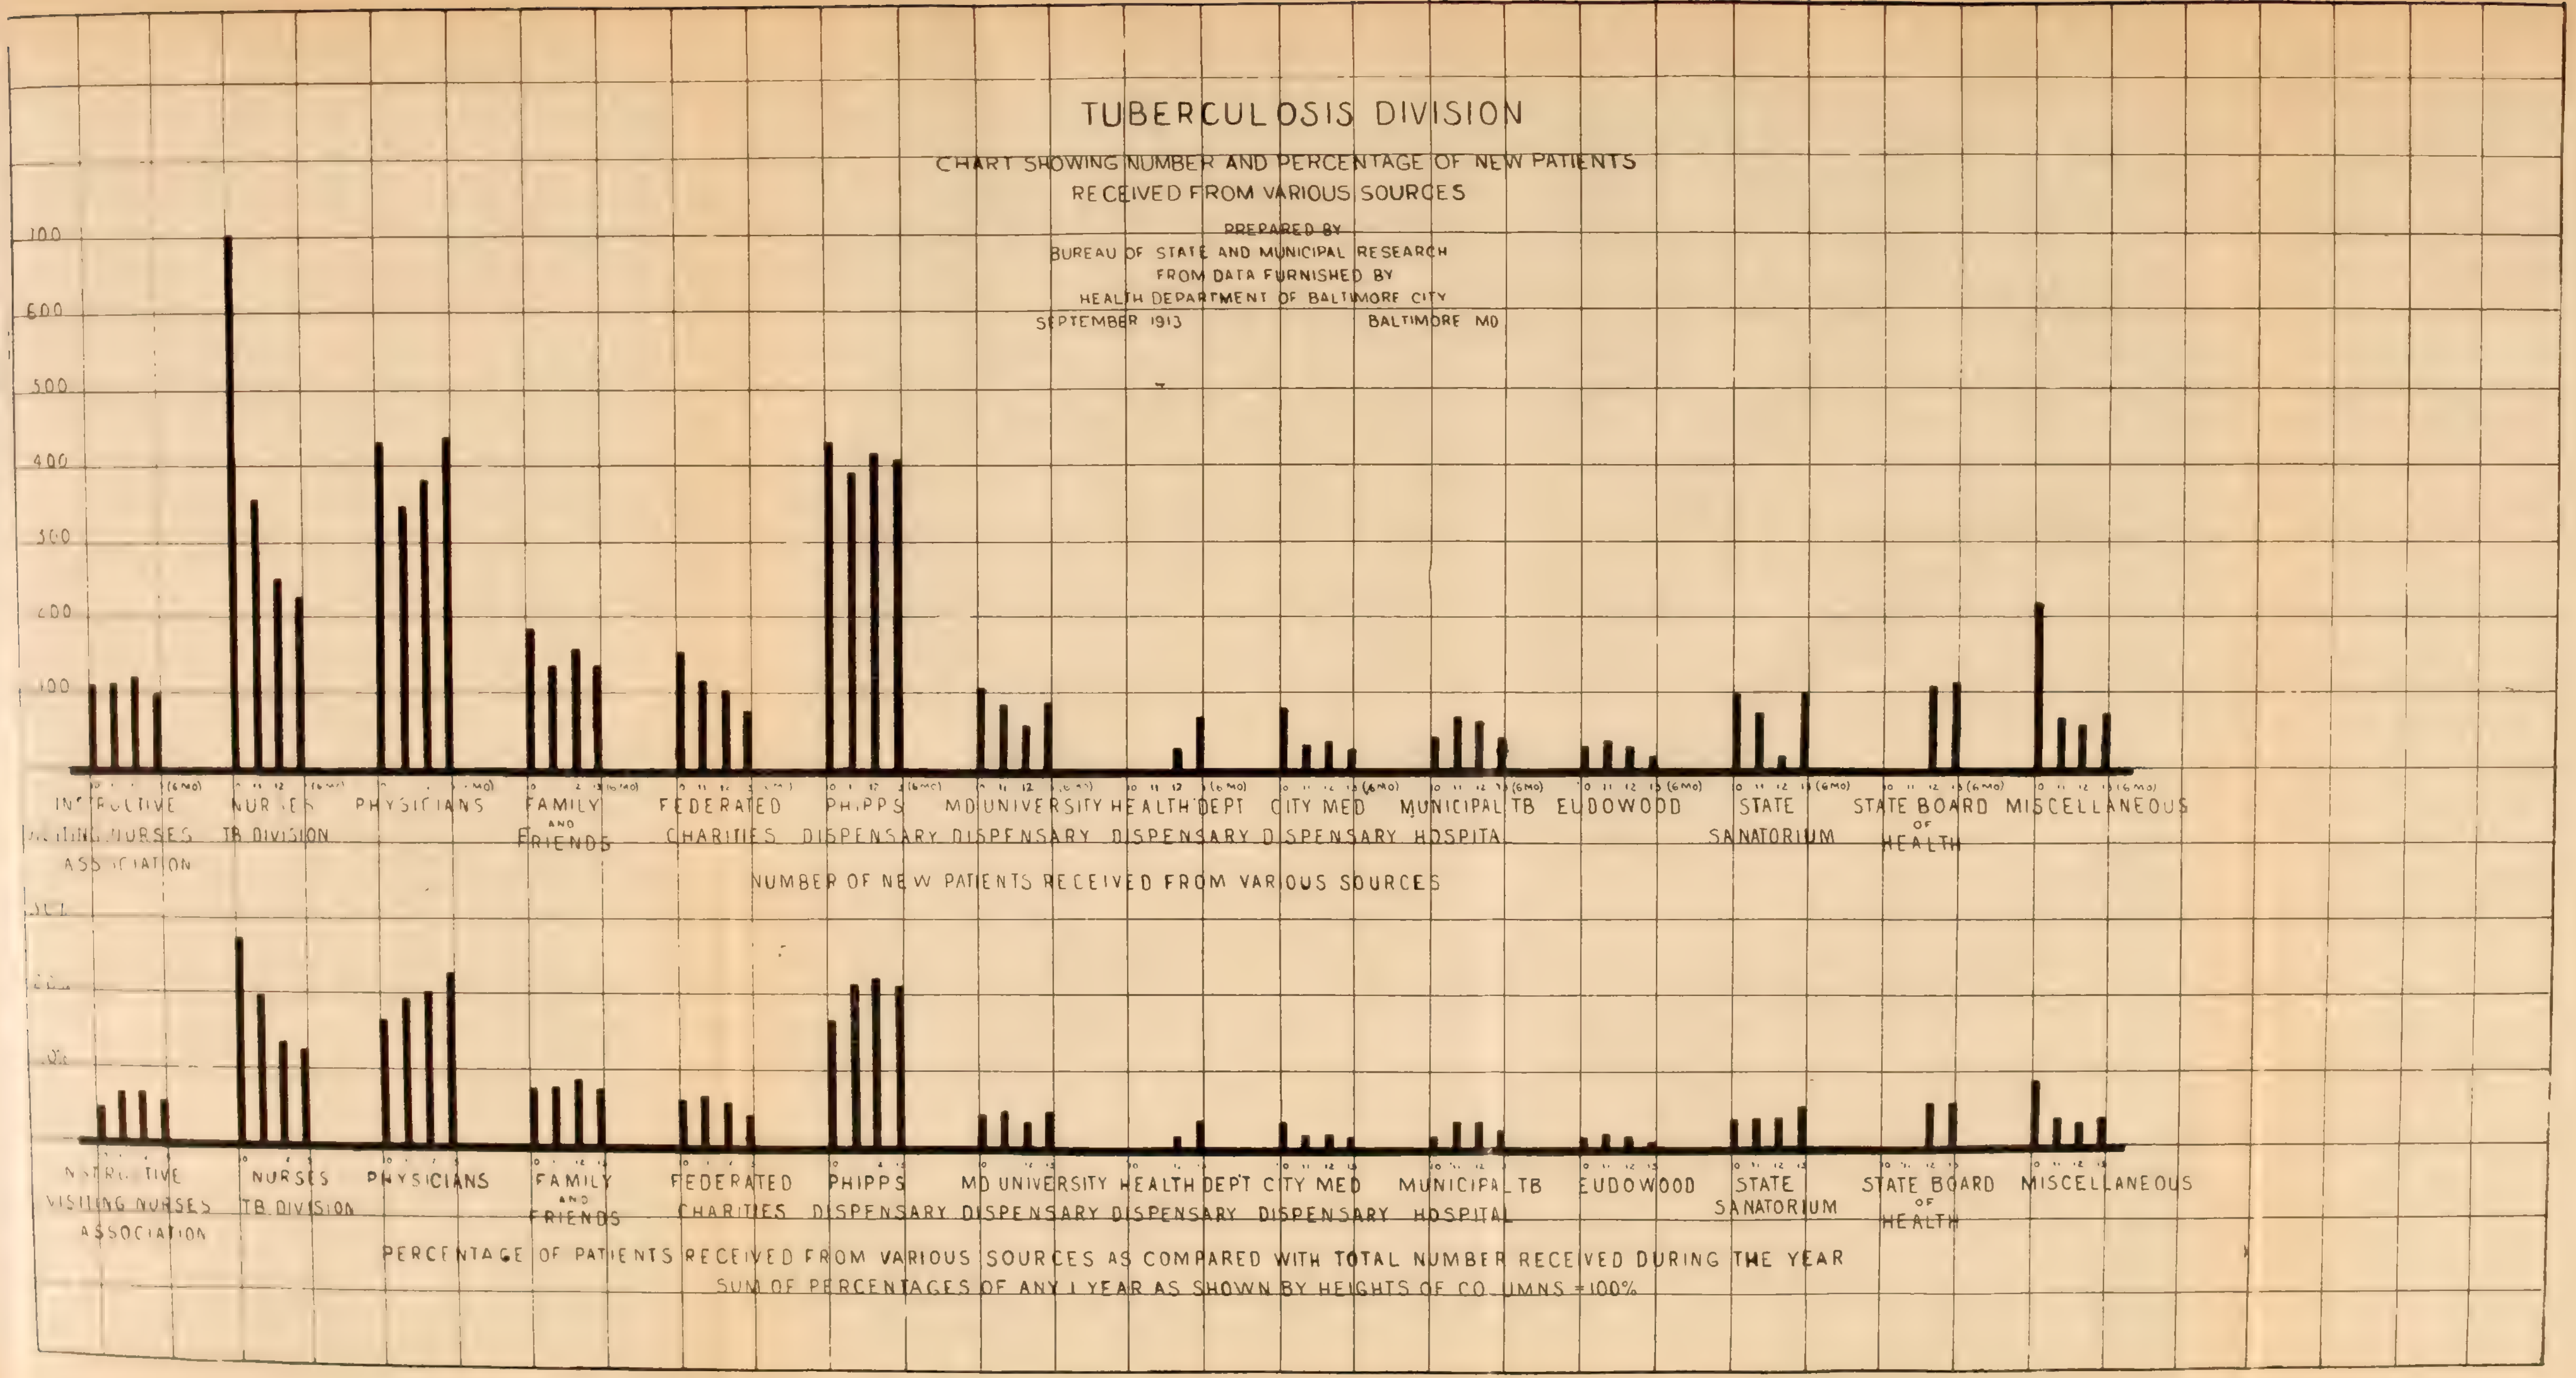
To RENDER all SOCIAL AID possible for the necessary changes in living and working conditions, by referring the patients to the proper persons and organizations, and personally conferring with them in regard to these changes and the necessity for them.

To assist in the tuberculosis dispensaries of the Health Department and of the University Hospital—so that THE NURSE will be A PERSONAL LINK between the tuberculosis dispensaries and the homes of the city in which the disease is found.



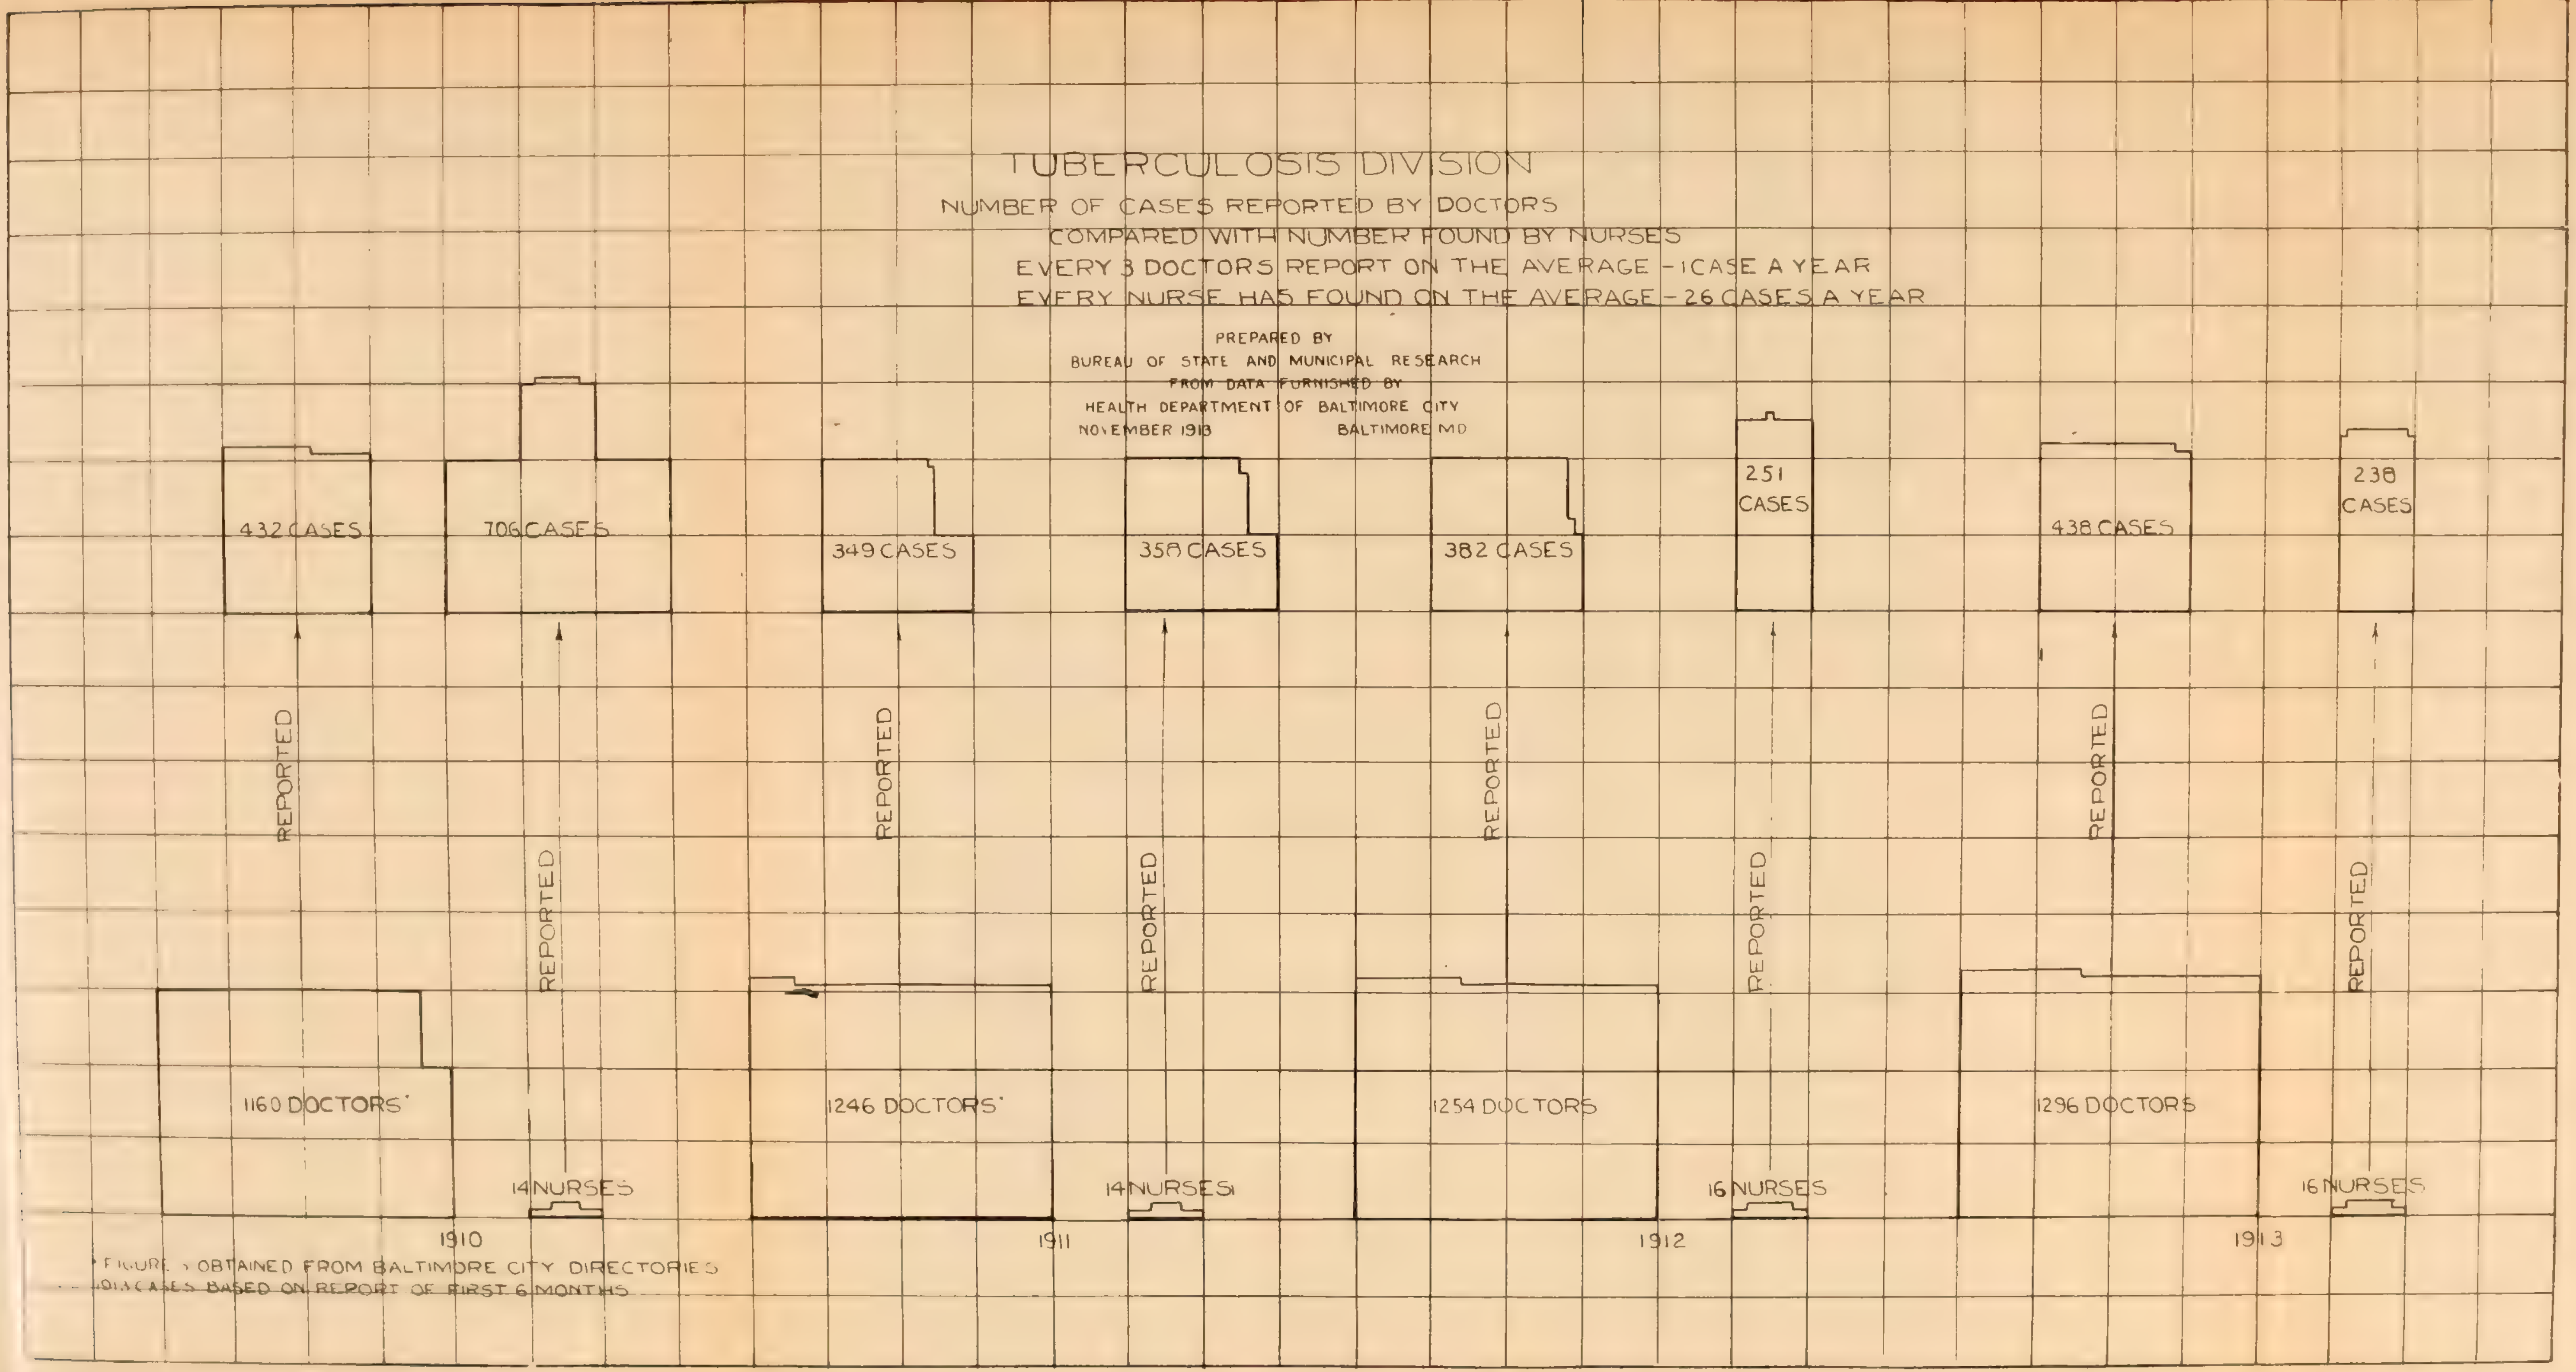
The Tuberculosis Division was organized January 1, 1910. Prior to that time the number of deaths from tuberculosis exceeded the number of cases registered with the Health Department. Since then the opposite has been true.

There has been a steady increase in the number of cases registered, and also in the number under supervision. Still OVER TWO-THIRDS of the tuberculosis CASES in the city are supervised. ONE-THIRD remain, who, either through ignorance or carelessness, are FREE TO SPREAD the DISEASE.



The INCREASE in the number of patients reported by physicians and family friends SHOWS that the PUBLIC is gaining more CONFIDENCE IN the Tuberculosis NURSES and is also learning from the instruction given by the Nurses the wisdom of having patients in the early stages of the disease properly cared for.

All cases reported by persons not qualified to make a diagnosis of the disease are examined by a physician before being registered



TUBERCULOSIS DIVISION

NUMBER OF CASES REPORTED BY DOCTORS
COMPARED WITH NUMBER FOUND BY NURSES
EVERY 3 DOCTORS REPORT ON THE AVERAGE - 1 CASE A YEAR
EVERY NURSE HAS FOUND ON THE AVERAGE - 26 CASES A YEAR

HEALTH DEPARTMENT OF BALTIMORE CITY
NOVEMBER 1913 BALTIMORE MD

* FIGURES OBTAINED FROM BALTIMORE CITY DIRECTORIES
- - 1913 CASES BASED ON REPORT OF FIRST 6 MONTHS

The SMALL PROPORTION of cases reported by doctors is DUE partially to the fact that many of the physicians of the city are specialists in some line and do not touch tuberculosis cases, but also because a great many of them, for PERSONAL REASONS, do not wish their patients to know that they have the disease, and so will not co-operate with the nurses in using preventive measures and thus guarding others from danger.

The DISPENSARIES were not opened until 1912, and one in 1913, but they have already PROVED their great WORTH to the community. Though the number of new patients treated in 1913 is less than that of 1912, the number of RETURN VISITS is greater—SHOWING that the dispensaries are of an EDUCATIONAL VALUE and that they are teaching the patients to take greater precautions before the disease reaches an advanced stage.

NOTE—When the dispensaries were opened the Health Department sent a special request to physicians of the city to turn over to the dispensaries all cases of pulmonary tuberculosis not convenient to handle in ordinary office practice:

NUMBER OF CASES RECEIVED FROM PHYSICIANS BY DISPENSARIES—*NONE.*

THESE CHARTS BRING OUT THE FOLLOWING POINTS:

1. CONFIDENCE of the PATIENTS.
2. OPPORTUNITY for EARLY TREATMENT
3. CONFIDENCE of the FRIENDS of the patients.
4. LACK of Sanatorium ACCOMMODATION
5. CHARACTERISTICS of NEGRO patients.
6. METHOD of TREATMENT

Report of Chief Tenement Inspector.

BALTIMORE, December 31, 1913.

NATHAN R. GORTER, M. D.,
Commissioner of Health.

DEAR SIR:

As Chief Tenement Inspector, I beg leave to submit my annual report for the year 1913, as follows:

Houses inspected	2,842
Houses reinspected	9,044
Complaints investigated	136
Notices issued	2,037
Nuisances ordered abated	4,576
Nuisances abated	2,919
Nuisances open or pending	3,133
Special inspections	982
Warrants sworn out	6
Warrants dismissed after nuisances abated	5
Convicted and fined twenty dollars and costs ($21.45)	1

Respectfully yours,

DANIEL W. SMITH,
Chief Tenement Inspector.

Report of Superintendent of Fumigations and Burials.

BALTIMORE, January 1, 1914.

NATHAN R. GORTER, M. D.,
Commissioner of Health.

Report of Registrar's Clerk.

BALTIMORE, December 31, 1913.

NATHAN R. GORTER, M. D.,
Commissioner of Health.

DEAR SIR:

I respectfully submit my annual report of all transcripts issued from January 1, 1913, to date, with statement of purposes for which they were required, amounts received, and paid the City Comptroller each month since the collections have been made at this office, during this year, instead of being paid direct to the City Comptroller, as prior to 1913, together with report of other matters in any charges.

TRANSCRIPTS ISSUED.	1912.	1913.

December	102	7 50	107	87	401
Totals	1,408	$299 00	1,691	833	5,128

This table shows that there were only 424 birth transcripts issued in 1912 and 1,408 in 1913. Besides there were 1,691 applications of which there were no records, while in 1912 there were only 369. The searches .in 1912 were only 739, while in 1913, under free law, there were 5,128. The loss on those issued amount to $418, and the loss from no record, viz.: 1,691, "Failure of Doctors and Midwives to Report," would have been $845.50 more, or a total of $1,263.50, which is within $60.20 of the entire receipts of the year, viz.: $1,323.70, for all deaths, transcripts and paid births. Except for this law and the no records the receipts of this desk would have been $2,587.20.

It would appear to me proper that all persons who are to be pecuniarily benefited by the possession of transcripts of their births should certainly be able to pay for them, since they are thus enabled to earn wages or salaries through their possession. The State Health Department charge for all transcripts issued, no matter for what purpose. •

While many we are issuing free, at present, are to the children of persons residing outside our city limits to enable their children to work here while their parents pay taxes to the State.

In December, 1912, there were 51 birth transcripts issued that paid the city $26. *None were free.* In the current month (1913) there were 102 issued and only 15 *were paid for* ($7.50), while the balance, 87 free, created a loss of $43.50, not including the 107 no-records, which would swell the loss for the one month to $97. At least one-half of the birth transcripts issued *free* were from one to two hours evening work, selling papers only, and most of the applicants stated they needed them because they "wanted a badge." If it had not have been for the children born here and living elsewhere, requesting records of their birth for school, employment, foreign, legal and other purposes required by the laws of the States or cities where they at present reside, and the new order of the United States Navy Department demanding the certificates of sailors, marines and others connected with the navy to establish the fact of their nationality in order to receive extra pay, we would have been without any revenue from births whatever since last April. The letters I have had to write in reference to these out-of-town applications will exceed 1,500.

The total number of transcripts issued in 1905, births and deaths, were 1,190, receipts $600.50. In 1900 1,723, receipts $875; in 1912 2,201, receipts $1,126.10, and in 1913 3,436, receipts $1,323.70. Since January 1, 1913, all payments have been paid direct to me and I had to settle the same with the City Comptroller; prior to this year transcripts were not issued until they were endorsed "paid" by the City Comptroller before I filled them out. This year the Comptroller has been relieved of making 3,436 entries in his books, as heretofore, a great saving of books and labor to his department, but a very great addition to my work.

I have thus entered into these details in order that you may fully understand that we may look for double work the coming year (1914) if the present law stands, since I am satisfied that a great advantage will be taken of the city if this free issue continues. The children know about it and inform each other that all they have to do is to go to the State Board of Statistics and get a yellow card, and it will not cost them anything, and it appears that all who apply for these cards get them.

Again, a matter to be taken into consideration is the cost to the city for each of these transcripts when the expenses of these transcripts are looked into. This expense includes the original certificates issued in book form with stubs for physicians and midwives, the indexing and indexes of same, the blanks needed for the applications and transcripts, the book of record, the salaries of the index clerk, and the registrar's clerk, the binding and labelling of the certificates, in addition of the cost of the vault to protect these records, etc. It is very possible, when the other costs of stationery and postage added, it will be seen that each of these transcripts cost the city fully what the law originally required them to cost, if not twice as much, and this loss will increase yearly as the city grows.

I would suggest, in conclusion, that the birth certificates hereafter be printed upon pink paper instead of white, since all the applications and transcript blanks of same are thus printed and volumes filing them bound in red, thus they will not only be uniform, but also easier to distinguish from the deaths.

Respectfully submitted,

GEORGE C. WEDDERBURN,
Registrar's Clerk.

Report of Complaint Clerk.

BALTIMORE, December 31, 1913.

NATHAN R. GORTER, M. D.,
Commissioner of Health.

DEAR SIR:

I respectfully submit herewith report of work done through the office of Complaint Clerk for the year ending December 31, 1913.

You will note there are two tables, one showing the total number of personal complaints, the other giving a list of those abated with the assistance of the Plumbing Division.

In addition to these two tables there were received from the various police districts 5,340 reports containing 28,856 complaints of nuisances, from which, and including the personal complaints, there were sent out from this office by the health wardens 34,995 notices.

Personal Complaints.

To classify all complaints received in this office under their respective headings would require a space entirely too large to have same arranged properly in book form. I have, therefore, given those of most frequent occurrence, while others, which are made up of various and trifling causes are placed under the heading of "Unsanitary Conditions."

You will note these figures in the aggregate compare closely with those for the year 1912. The connection of numerous dwellings in the city with the new sanitary sewers during the year 1913 should naturally improve conditions considerably as far as overflowing privies, defective drainage, water in cellars and yards, etc., are concerned, but at the same time it can be seen that the new system will, for some time at least, require considerable attention of this Department in the abatement of nuisances, such as choked sewers and other conditions in consequence of same.

Respectfully submitted,

T. WARFIELD BURGESS,
Complaint Clerk.

Report of Commissioner's Clerk.

BALTIMORE, December 31, 1913.

NATHAN R. GORTER, M. D.,
Commissioner of Health.

DEAR SIR:

As Commissioner's Clerk, I hereby respectfully submit a report of the work done by me for the year ending December 31, 1913:

No. of letters sent out by the Bacteriological Laboratory........	12,775
No. of lètters sent out by the Food and Dairy Division..........	8,120
No. of notices sent to undertakers..............................	550
No. of semi-weekly reports sent to public schools...............	193,200
No. of semi-weekly reports sent to parochial schools............	82,541
No. of letters sent to factories................................	360
No. of monthly reports sent out.................................	21,600
Total...	319,146

In addition to the above my work has consisted of delivering in person all necessary supplies for the use of the medical inspectors and nurses of the public and parochial schools; the sending out and filing of the daily and complete reports of the five medical inspectors and nurses of schools, delivering the lists of the unvaccinated children to the health wardens, and receiving and filling their reports on same.

My work has also consisted of the setting up in print on the multigraph, circular letters and forms for the various departments; setting up, counting and sending out and folding of the semi-weekly reports to the schools of the infectious diseases.

In addition I have charge of the outgoing mail, keep a monthly account of the stamps used by the various departments, and turn a monthly statement of the same into the secretary each month.

I assisted Dr. C. Hampson Jones from time to time as I was needed.

Respectfully submitted,

C. V. DENNIS,
Commissioner's Clerk.

Report of Burial Permit Clerks.

BALTIMORE, January 1, 1914.

NATHAN R. GORTER, M. D.,
Commissioner of Health.

DEAR SIR:

We hereby respectfully submit the report of the work done by the burial permit clerks for the year ending December 31, 1913.

The following table exhibits a summary of the various kinds of permits issued during the year:

MONTHS.	Burial Permits, City.	Burial Permits, Transit.	Burial Permits, Still Births.	Burial Permits, Shipping.	Burial Permits, Shipping Dup't.	Burial Permits, Disinter.	Removal Permits.	Total
January	935	123	75	117	117	13	463	1,843
February	914	114	86	128	128	16	453	1,839
March	983	129	71	132	132	28	495	1,970
April	890	130	77	115	115	51	484	1,862
May	969	114	71	135	135	55	435	1,914
June	883	107	68	117	117	23	441	1,756
July	1,021	132	72	135	135	6	491	1,992
August	865	128	64	119	119	7	431	1,733
September	766	116	72	124	124	44	344	1,590
October	790	118	65	116	116	52	340	1,597
November	775	105	85	111	111	41	332	1,560
December	926	125	87	134	134	27	438	1,871
Totals	10,717	1,441	893	1,483	1,483	363	5,147	21,527

During the year there were received from cemeteries and transportation companies 14,897 burial disinterment and shipping permits, which have been placed in numerical order and the same have been filed for reference.

Respectfully submitted,

HARRY C. ANDREWS,
ROBERT R. KRAUTER,
Burial Permit Clerks.

Report of Nuisance Clerk.

BALTIMORE, May 13, 1914.

NATHAN R. GORTER, M. D.,
Commissioner of Health.

Total	14,648	15,037

Respectfully submitted,

EDWARD H. THOMPSON,
Nuisance Clerk.

Report of Index Clerk.

BALTIMORE, January 1, 1914.

NATHAN R. GORTER, M. D.,
Commissioner of Health.

DEAR SIR:

I beg to submit the following report of work performed by me during the year ending December 31, 1913:

Number of deaths indexed	10,717
Number of births indexed	12,542
Number of still births indexed	893

I have also written a complete typewritten list (in duplicate) of all deaths and births that occurred during the year 1912 (which is used by the printer for the printing and binding of same) which were as follows:

Number of deaths	10,441
Number of births	11,398

Respectfully submitted,

MAURICE W. JOINT,
Index Clerk.

Report of Clerk to Bureau of Vital Statistics.

BALTIMORE, December 31, 1913.

NATHAN R. GORTER, M. D.,
Commissioner of Health.

DEAR SIR:

I hereby respectfully submit for your consideration the report of the division over which I have supervision.

As has been the custom, all cases of infectious diseases reported have been recorded and placed on file by card index; report cards of health wardens of all cases also on file for reference. Cards of physicians reporting contagious diseases to this department have been filed in their respective wards. Maps of the various diseases have been gotten out from time to time showing the location of cases of contagious diseases reported.

Below will be found the number of cases reported from January 1, 1913, to December 31, 1913:

	1913.	1912.
Smallpox	50	15
Diphtheria	1,309	1,039
Scarlet fever	1,138	750
Typhoid fever	1,163	1,083
Measles	5,724	624
Mumps	161	53
Whooping cough	290	408
Varicella	595	488
Tuberculosis pulmonalis	1,541	2,248
Poliomyelitis	2	25

There has been kept a complete record of all midwives registered during the year, and transcripts sent to the State Board of Health; also a record of licenses for the purpose of boarding babies after application to this department for same having been made and inspections having been made and reported on by the health wardens in each ward where the applicant resided.

Respectfully submitted,

CHARLES W. BUSICK,
Clerk to Bureau of Vital Statistics.

REPORT

Department of Public Safety—Improvements,
Sub-Department Office Inspector of Buildings,
City Hall,

Baltimore, December 31, 1913.

To the Honorable the Mayor
and City Council of Baltimore.

Gentlemen: I herewith submit summary and tables of work done under the supervision of this office for the year ending December 31, 1913.

This Department in 1913 issued 41,324 permits for the erection of new buildings, additions, alterations and repairs, installing gas fitting, heating apparatus, electric appliances, elevators, fire alarm gongs, etc., aggregating $16,004,639.80, as compared with 53,075 permits issued in 1912, aggregating $14,479,373.90.

The following is a statement of contract work awarded by Board of Awards during 1913:

No. 83 School, 50 per cent. finished.

Shed, Ridgely Street Stable, finished.

Pratt Street Stable, mezzanine floor, completed.

Plumbing and drainage, Court House, completed.

Engines, turbines, Polytechnic Institute, 90 per cent. completed.

Additional mechanical equipment, Polytechnic Institute, 90 per cent. completed.

Municipal Garage, completed.

Cow barn, Bay View, 90 per cent. completed.

Fire protection, Bay View, 80 per cent. completed.

Recreation Pier, 30 per cent. completed.

Fixtures, Nos. 6, 22, 27 and 99 Schools, and Polytechnic Institute, completed.

Domestic science room, Eastern High School, completed.

Superintendent's home, Sydenham, 95 per cent. completed.

The following work has been started:

Installing cabinet, City Hall rotunda.

Grading, No. 51 and No. 59 schools.

Grading grounds, Polytechnic Institute.

Seventy-six sewer connections were made to various city buildings, including Court House, markets, schoolhouses, engine-houses, truckhouses, city stables, etc.

There was an aggregate of about 15,000 horsepower installed, which included electric motors, boilers, gas and gasoline engines, etc., in 1913.

Application was made to utilize buildings limited as to location in 66 instances.

Under the building code there is a right of appeal from the decision of the Inspector of Buildings from any decision he may give pertaining to building construction. I am gratified to report that there has been no appeal from any of my decisions. This speaks well for the harmonious conditions existing between the builders and the city.

Inspections are being made constantly on fire-escapes, moving-picture parlors, theatres, places of public assemblage, factories, sweat-shops, and virtually all buildings where people are employed or where they assemble, so as to safeguard them.

City Property.

There are 30 engine-houses, 14 truckhouses and one high pressure fire line station. The majority of the houses are in fair condition.

MARKETS.

There are nine markets:

Belair Market is in good condition.

Broadway Market is in good condition.

Centre Market is in good condition.

Hanover Market is in fair condition.

Hollins Market is in fair condition.

Lexington Market—Much money is spent on this market yearly; same is in very good condition.

Lafayette Market is in good condition.

Northeast Market is in need of reconstruction; appropriation was requested from Board of Estimates relative to same, but the Board declined to appropriate same, on account of the revenue derived from stall-owners not warranting the expenditure.

Richmond Market—This market is being enclosed in glass, in accord with the wishes of the tenants; same is in good condition.

POLICE STATIONS.

There are nine police stations. The condition of these houses is fair—the majority need painting.

STREET CLEANING DEPARTMENT.

The condition of the majority of these stables is very good, with few exceptions. Repairs are being made as my appropriation permits.

CITY HALL.

The corridors of the City Hall are in need of painting. I have been unable to do this on account of appropriation not being allowed.

CITY HALL ANNEX NO. 1.

This building is occupied by the Health Department and office of Bay View Asylum. Same is a rented building. The conditions could be improved, but it is not deemed advisable to do so on account of improvements contemplated to take care of Health Department at the Old Polytechnic Institute on Courtland street.

CITY HALL ANNEX NO. 2.

This property is located on Guilford avenue and is occupied by the Street Cleaning Department, Electrical Commission, Topographical Survey Commission, and Free Public Bath Commission. Same is in fair condition.

COURT HOUSE.

This building is in good condition.

PEOPLE'S COURT.

Quarters are occupied by the People's Court in New Produce Market, and same are in good condition.

QUARANTINE.

The Quarantine quarters are utilized by the Health Department and are in very good condition.

CITY MORGUE.

These premises are utilized by the Health Department and are in very good condition.

CITY GARAGE.

Same is located in basement of Old Polytechnic Institute, and is in good condition.

Bay View Asylum.

The fire-proofing of main building is about completed and will relieve anxiety as to fire hazard. Ward Building "A" is in good condition. The new power-house is in first-class condition. The service building is a new building. Sydenham Hospital is in fair conditon. New cow and feed barn is about completed, also home for superintendent at Sydenham.

City Jail.

The conditions at the Jail are very good. Warden Lee's course in utilizing the prisoners to make repairs, painting, etc., has saved the city considerable money.

Heating City Hall and Court House.

The pipe line connecting Court House and City Hall with High Pressure Pipe Line Station has been in operation about a year and has been working satisfactorily.

Schools.

The general condition of the majority of the schools is very good; a great many of them require painting, both interior and exterior, and this is being done as rapidly as appropriations permit.

School No. 27, School No. 22, School No. 6, and the Polytechnic Institute, all new buildings, were completed and occupied during the year 1913. They have relieved congestion in their respective localities and have also eliminated the necessity of housing children in rented property. The new schools are up-to-date in every particular, having every modern convenience.

Moving Picture Parlors.

Through an understanding with Mr. Daniel J. Loden, Collector of Water Rents and Licenses, permits or licenses were withheld from moving picture parlor applicants until all conditions relative to exits, etc., were satisfactory to this Department. Inspectors are continually inspecting the above so as to prevent accidents. Every safeguard has been taken to protect the public as far as possible.

Fire Escapes.

Inspections are being made daily by this Department as to fire escapes. In a great number of cases my inspectors have found exits blocked by work benches, etc., and these conditions are rectified immediately. The Fire Department and this Department are working in perfect accord to relieve dangerous conditions wherever existing.

Respectfully submitted,

Clarence E. Stubbs,
Inspector of Buildings.

SUMMARY AND TABLES

STATEMENT OF APPROPRIATIONS AND DISBURSEMENTS ABOUT THE OLD CITY PROPERTY.

Repairs to city property, consolidated	$161,700 00	Schools	$78,726 69

Annual Report

Department of Legislative Reference

To the MAYOR AND CITY COUNCIL OF
BALTIMORE *for the* FISCAL YEAR
ENDED DECEMBER 31,
1913

BALTIMORE
MEYER & THALHEIMER
CITY PRINTER
1914

REPORT

BALTIMORE, January 2, 1914.

To the Honorable the Mayor and City Council of Baltimore.

GENTLEMEN:

I submit herewith the annual report of the Department of Legislative Reference for the year ending December 31, 1913.

The Department was called upon more frequently for information during the year 1913 than for any previous year of its existence. Information on important subjects, particularly those relating to municipal questions, is continually being collected and indexed, so that as a general rule some information at least can be given on most of the important municipal questions. If the desired information is not on file however, steps are taken at once to secure it. Soon after the November election a letter was sent to each member of the Legislature, calling attention to the work of the Department. This has been the policy pursued by the Department since its establishment in 1907 and the results would certainly seem to justify the advisability of doing this at each session of the Legislature, since there are so many changes in the membership of that body. The following is a copy of the letter which was sent to the members of the present Legislature:

> I am writing to call your attention to the work of this Department and to ask your assistance in making it possible for us to collect and compile information which may be useful during the coming session of the Legislature. I am sending you under separate cover a copy of my last report, which will give you some idea of the kind of work we try to do and of the material already on file. I would appreciate it, however, if you would inform me as soon as convenient of the special

topics in which you are interested and about which you desire information. If it is not already on file, I will try to secure it for you. Your request will be regarded as confidential.

This Department is non-political and non-partisan and if I can be of any service to you do not hesitate to call upon me.

This Department expects to receive during the present session of the Legislature fifteen copies of all bills which are introduced into the Legislature and these will be indexed each day as they are received. A card has been devised for the purpose of showing the progress of the more important bills. Particular attention will be given to the bills which relate to the City of Baltimore. There is a complete file of the bills introduced at the 1908, 1910 and 1912 sessions of the Legislature, for which there is a very full and complete index.

It is not possible to give a complete list of the topics on which information has been given, but among these may be mentioned the following on which information was supplied during the past year:

Fisheries.
Initiative and referendum.
Health—Laws.
City Forester.
Paving—Assessments.
Home rule.
Gas—Rates.
Finance reports of States.
Finance reports of cities.
Child labor—Laws.
Schools—Reports.
Schools—Laws.
Boards of control.
Supply departments.
Tax commissions.
Taxation.
County government.
Employers' liability.
Milk inspection.
Fire prevention.
Maryland statistics.
Blue sky laws.
Coal production.
Municipal markets.
Harbors—Laws.
Port development.
Population.
Juries—Verdict.
Constitutions.
Wheel tax.
Waterworks—Finance.
Street cleaning.
City planning—Laws.
Elevator devices.
Inebriates.
Commission government.
Refuse collection.
Street railways — Government ownership.
Somers' system of assessment.

Minimum wage.
Mothers' pensions.
Factory laws.
Serial bonds.
Dance halls.
Negro segregation.
Jim crow laws.
Tenement house laws.
Sunday observance.
Municipal ice plants.
Banking laws.
Fireworks—Laws.
Maryland towns—Charters.
Public utilities—Extensions.
Excess condemnation.
Explosives—Laws.
Liquor licenses.
Maryland—Minerals.
Budget exhibits.
Moving pictures—Censorship.
Street railways—Taxation.
Salaries and fees.
Consolidation of schools.
Legislative procedure.
Boroughs.
Judges—Salaries.
Probation system.
Mortality statistics.
Social evil.
Cost of living.
Noise—Laws.
Smoke prevention.
Cold storage.
Loan sharks.
Accounting.
Automobiles—Laws.
Boards and commissions.
City deposits.
Schools—Neighborhood use.
Sewers—Laws.
Parcel post.
Public works departments.
Complaints bureaus.
Savings bank insurance.
Vent pipes.

Other cities have recognized the value of departments of this kind, so that at the present time similar departments are in operation in New York, Chicago, Philadelphia, St. Louis, Cincinnati, Milwaukee, Kansas City (Mo.), Minneapolis, Oakland, Portland (Ore.) and Toronto. New York, Chicago, Cincinnati and Portland (Ore.) established their departments during the past year. Other cities are considering the question and the National Municipal League is co-operating in this work, for it recognized that the establishment of such departments promotes mutual co-operation and facility of exchange of information, thereby increasing the efficiency of each department.

The following list, while not exhaustive, will give some idea of the kind of material on file in the Department:

Agricultural co-operative credit associations.
Art commissions.
Assessments—Special.
Automobiles—Municipal.
Apportionment of representation.
Bakeries—Sanitation.
Banks—Co-operative.
Banks—Laws.
Banks—Reports.
Banks—Taxation.
Bar associations.
Baths.
Buildings—Laws.
Billboards.
Bill drafting.
Blind.
Boards and commissions.
Bonds—Serial.
Bonds—Taxation.
Budgets.
Corrupt practices.
Corporations—Laws.
Commission government.
Condemnation of land.
Civil service.
Conservation.
Charter revision.
Charters and ordinances.
Charities.
Cigarettes.
City planning.
Civic associations.
Child labor.
Complaint bureaus.
Cold storage.
Convict labor.
Cost of living.
Counties—Government.
Dance halls.
Dangerous trades.
Depositories —Laws.
Diseases—Industrial.
Divorce.
Dogs—Licenses.
Drinking cups.
Drugs.
Efficiency.
Elections—Laws.
Electric lighting—Rates.
Elevators.
Electric signs.
Electrocution.
Employment bureaus.
Employers' liability.
Excess condemnation.
Explosives.
Express companies.
Franchises.
Financial reports of States.
Financial reports of cities.
Filtration.
Fire departments—Equipment.
Fire protection.
Fish—Laws.
Food—Laws.
Flies.
Forestry.
Factory inspection.
Garages—Municipal.
Garbage—Collection.
Garbage—Disposal.
Grade crossings.
Gas—Rates.
Grain inspection.
Governors' messages.
Home rule.
Housing.

Harbors.
Hours of labor.
Immigration.
Illiteracy.
Income tax.
Inebriety.
Inheritance tax.
Indeterminate sentences.
Industrial education.
Industrial accidents.
Insurance—Investments.
Insurance—Laws.
Insanity.
Irrigation and drainage.
Initiative and referendum.
Juvenile courts.
Juvenile delinquency.
Jury commissioners.
Legislatures—Expenses.
Legislatures—Printing.
Legislative procedure.
Legislative reference work
Licenses.
Laws of States.
Loan sharks.
Lobbying.
Labor—Laws.
Labor—Reports.
Liquor licensing boards.
Liquor problem.
Municipal courts.
Municipal leagues.
Municipal ownership.
Municipal research.
Municipal newspapers.
Municipal lighting—Reports.
Municipal lighting—Rates.
Mayors' messages.
Motion pictures—Censorship.
Mosquitoes.
Meats.
Markets.
Milk.
Mines and mining.
Municipalities—General.
Maryland Legislature.
Negro suffrage.
Negro segregation.
Noise.
Oysters.
Old age pensions.
Open-air schools.
Pensions—Mothers'.
Primary elections.
Paving.
Public comfort stations.
Prisons.
Probation.
Parole.
Police—Uniforms.
Police departments.
Presidential preference primaries.
Plumbing.
Proportional representation.
Public service commissions.
Parks.
Playgrounds.
Parcel post.
Postal savings banks.
Public utilities.
Public health.
Rats.
Railroads—Rates.
Railroads—Regulations.
Railroads—Terminal facilities.
Railroads—Electrification.
Roads.
Recall.
Representation.
Salaries and fees.
Savings banks—Insurance.
Short ballot.
Single tax.
State constitutions.

The following list, while not exhaustive, will give some idea of the kind of material on file in the Department:

Agricultural co-operative credit associations.
Art commissions.
Assessments—Special.
Automobiles—Municipal.
Apportionment of representation.
Bakeries—Sanitation.
Banks—Co-operative.
Banks—Laws.
Banks—Reports.
Banks—Taxation.
Bar associations.
Baths.

Water supply.
Water rates.
Waterways.
Weapons.
Weights and measures.
Woman suffrage.
Workmen's compensation.

During the past year there were added to our collection two hundred and eighty-two books and fifteen hundred and eighty-two pamphlets, making a total of twenty hundred and twenty-seven books and ninety-six hundred and seventeen pamphlets. In addition to the books and pamphlets, there is quite a collection of magazines, legislative bills of other States, newspaper clippings, duplicate copies of the more important pamphlets and documents, as well as a complete file of the bills for the last three sessions of the Maryland Legislature. During the year quite a number of compilations were made, among which may be mentioned the following:

Vent pipes.
Complaint bureaus.
Anti-noise ordinances.
Legislative procedure.
Excess condemnation.
Taxation of banks.
Extension of public utilities.
Elevator devices.
Departments of public works.
Tax rates of cities.

Over five hundred documents and pamphlets were loaned; but, of course, the greater number of inquiries were answered at once or the information forwarded without the necessity of letting the documents leave the office. Over four thousand communications were sent out from the Department, either asking or giving information.

The total expenditures of the Department for the year 1913 were $3,629.25.

The officials of the city and State have been extremely kind and courteous in furnishing the Department with information, reports, etc., when so requested, and I desire to take this occasion to extend my thanks for the co-operation and assistance which has been extended to the Department by them.

I also desire to take this occasion to commend the industrious and efficient work of my assistants, Misses Ella S. Hitchcock and Nellie W. Mewshaw, who have aided so greatly in increasing the usefulness of the Department.

Respectfully submitted,

HORACE E. FLACK,
Executive.

MILTON B. WILLIAMS, Esq.
JAMES T. STUART, Esq.

WILLIAM S. MANNING, *General Superintendent.*
J. V. KELLY, *Secretary-Treasurer.*

Report of the Board of Park Commissioners

BALTIMORE, March 2, 1914.

To the Mayor and City Council of Baltimore.

GENTLEMEN—The Board of Park Commissioners herewith submit their report for the year 1913.

Attached to this report is the report of the General Superintendent containing a general summary of the work done by this Department and also the financial report prepared and submitted by the Secretary and Treasurer of the Board.

During the past year the Board employed Messrs. Haskins & Sells, certified public accountants, to audit the accounts of all the park-tax-paying railways in the city in regard to that tax, and their report has been submitted showing that the city is receiving the full amount due, unless certain questions of law involved in the calculation of the tax and raised by the report should be decided contrary to the views acted on by the United Railways and Electric Company. These questions have been submitted to the City Solicitor for his opinion.

The most important land acquirement during the year was the consummation of the purchase of the Bergner property, negotiated in 1912, at the price of $36,000. This property runs from North avenue near Eleventh street (sometimes called Hilton street) to Gwynn's Falls Park and adjoins the Hilton property, which is situated at the corner of North avenue and Eleventh (or Hilton) street, purchased in 1912. In this connection we might call attention to the exchange of several parcels of land (part of the Bergner tract) with the Francis White estate. By these purchases and this exchange the city owns for park purposes, in fee simple, the entire block fronting on North avenue, from Eleventh street to the line of

Twelfth street, when opened. Some little work has been done on the Bergner property in clearing up and making it more available and attractive for park purposes, and permission to the public to fill on the Hilton property, which needs a considerable amount of material to bring it to proper grade, has been taken advantage of.

On the Frederick road, at the western end of the new bridge, the State Roads Commission, in the prosecution of their work, found it necessary to construct a high wall which would have practically destroyed the value of a residence located there. This property was almost surrounded by the Gwynn's Falls reservation and was within the proposed taking lines. The State Roads Commission offered to contribute the approximate cost of the wall to the purchase if this property were acquired by the Board, which was done at a cost of about $4,300; the State Roads Commission contributing $1,200 thereof.

It was decided to acquire, by purchase or condemnation, the nine properties fronting on Covington street, the back yards of which extended back to Federal Hill Park and have for many years been an eye-sore to those who use that park. Each of these properties, with one exception, had ground rents on them. All the ground rents have been acquired at the original price offered by the Board; namely, 5 per cent. There were several leasehold interests which could not be purchased at the price fixed by the Board, and the City Solicitor's office is now condemning the same. These lots, together with a lot on the corner of Hughes and Covington streets, acquired by the Harbor Board for the Key Highway, but which will not be used for that purpose for the present, and permission to use which for park purposes has been kindly given by the Harbor Board, will be devoted to playgrounds and tennis courts. The need for playgrounds in this immediate vicinity exists and has been appreciated for some time past. Accordingly, by this acquisition, not only will an eye-sore be removed from a park which is much used both by people living in that section and by many visitors to the city, who desire a bird's-eye view of the city and its splendid harbor and waterfront, but much needed playground facilities will be furnished.

In Wyman Park an old temporary wooden bridge which carried across a deep ravine the road sometimes called "Serpentine," after a life of more than ten years, began to show signs of decay and weakness. It was estimated that it could be repaired for approximately $4,000, but after repair it would not last but a few years. It was therefore decided to replace it with a concrete and rubble stone bridge, which would serve, if not forever, for at least several generations.

It was built under contract for a little over $16,000, a few dollars under the contract price, and paid for out of the fund set aside for maintenance.

The road served by this bridge is very much used, and its use in connection with the parkway uniting Druid Hill and Wyman Parks is constantly increasing.

The largest new improvement work was the parking and putting into shape of the so-called Patterson Park extension, which is separated from the main body of Patterson Park by Linwood avenue (formerly Patuxent street). The contract for this work was let to the lowest competitive bidder, and so far has cost about $54,000. The work under the contract has been completed, but there is still a good deal of work left to be done before this area will present the appearance of a completed park. It will contain, when finished, an area of about ten acres to be used for baseball, football, etc. The cost was taken out of that part of the loan authorized by the Act of 1904 standing to the credit of the southeastern section. This improvement and the Covington street acquisition, above referred to, will about exhaust the balance of the above-mentioned loan standing to the credit of that section.

The old ball field in Patterson Park was somewhat contracted and the use thereof somewhat interfered with because of the fact that the field was not on a uniform grade. As the work of the contractors on the sewerage system proceeded, certain of them asked for permission to deposit on this field the material excavated in the construction of the sewers in this neighborhood. Our Board took advantage of this opportunity and granted the permission under definite terms, etc., as to the character of the material, the disposition of the same and the saving of the top soil, etc. Under this permission, 31,553 cubic yards were deposited, and the contractors not only observed the various conditions and restrictions, but paid about $500 for the privilege of depositing and $451.72 for the excess over and above 25,000 cubic yards originally agreed upon. If this improvement had been made in ordinary times, when material fit to deposit in large quantities is scarce, the cost of the work would have been at least $15,000.

The City Springs Square, which is the best illustration of and argument for the need of small squares in our very congested neighborhoods, was improved by moving out the fences surrounding the children's playground and thereby increasing the area thereof.

In Riverside Park, the area devoted to the children's playgrounds, lawn tennis, etc., was also increased.

Attention may be called here to the increasing demand for tennis courts where there are none, and for more where they are. Thus, in Latrobe Park three courts were installed and in Clifton Park eight new courts were added. In Patterson Park, which already has many courts, it is expected to increase the number considerably during the coming year.

In Carroll Park the roads and paths were repaired and improved by the use of gravel and material taken from park property.

The forestry work commenced last year is going steadily forward and it is hoped that before the work is completed every tree is the various park areas will be carefully inspected and properly treated when necessary. The importance of the work of preserving the magnificent tree growth in our parks can hardly be exaggerated.

In the past year a large auto truck was purchased and its main use has been hauling the manure from 1,200 or 1,500 horses in the stables of the Fire Department, Street Cleaning Department and private stables scattered over the city. This arrangement with the other departments has been in effect but a comparatively short time, but, so far, has been satisfactory to all departments concerned. The work of the auto truck was so efficient and satisfactory that a new one has been purchased.

The two broad general propositions which have received serious consideration from the Board are the completion of the connecting parkways and the acquisition of two or three small squares for the eastern section of our city, where the population is most congested.

As to the first, a contract for the opening and improvement of Thirty-third street, which will run from Charles street to the Hillen road and form part of the connecting parkways between Wyman and Clifton Parks, has been let by the Commissioners for Opening Streets. This Board has appropriated $50,000 to cover the work of parking, etc., of this roadway. To complete the connection between Wyman and Clifton Parks, it is proposed to open and construct a wide parked street intersecting with Thirty-third street east of Venable Park and running in a general southeasterly direction to Harford road to a point opposite the main entrance to Clifton Park. We understand that in all probability this improvement will be undertaken during the present year. The most important, so far as expense is concerned, of these connecting parkways is Gwynn's Falls Parkway, which will unite Druid Hill and Gwynn's Falls Park. The Commissioners for Opening Streets have made their report on the assessment of benefits and damages for this work, but inasmuch as there will be some litigation in connection with this improvement, it is not at all probable that it will be possible to start work on the entire improvement. It is understood, however, that a section of this parkway will be commenced during the coming year.

We may add that we believe that this improvement, when completed, will be of as much advantage and benefit to the northwestern section as Broadway has proven, in the past years, to be to the eastern section of the city.

Very respectfully,

BOARD OF PARK COMMISSIONERS,

GEORGE WEEMS WILLIAMS, *President.*

Report of the General Superintendent

BALTIMORE, February 25, 1914.

To the Honorable Board of
Park Commissioners of Baltimore.

GENTLEMEN—Following is a general summary of the operations of the Department of Parks and Squares for the year 1913.

There was appropriated for expenses in the parks and squares for the past year $527,375.50; for new improvements, $73,624.50; and for acquirement out of the unexpended balance of the one million dollar acquirement loan authorized in 1904, $119,411.27, together with $36,000 taken from the regular street railway company's 1912 receipts, for park purposes.

The detailed receipts and expenditures can be seen by referring to the various statements of the Secretary and Treasurer, which are embodied in this report.

The total park area under the jurisdiction of the Board of Park Commissioners is 2,401.64 acres, divided into fifty separate parkings—each street parking being considered as one park, although it may be a mile and a half long and divided by many cross streets. These separate parkings vary in size from approximately one acre to about 721 acres, which is the approximate area of Druid Hill Park.

Since 1905 there has been a very marked advance in the development of the parks for athletic and playground purposes, as well as a very marked advance in the careful upkeep of the finished areas, and a great deal done in the way of foresting and improving the condition of newly-acquired areas in the way of plowing, leveling and seeding, and in Gwynn's Falls

Park in making a walkway for pedestrians on the site of an old mill race, which winds along the side of the Gwynn's Falls Valley about half way up its side, providing a beautiful and most interesting scene for a distance of about three miles.

In Druid Hill Park there are twelve miles of roads and fourteen miles of paths, most all of the surfaces of which have been very materially improved and, during the last two years, nearly all of the macadam road surfaces have been treated with a liquid largely composed of tar, which was covered with coarse sand and fine gravel, rendering these surfaces smooth and hard and entirely preventing their erosion by heavy rains to which Baltimore is subject.

In addition to the usual supply of ground bone, tankage and condensed fertilizers, a large amount of which is annually used, there has been used during the past year the product of 1,200 horses collected from the various Fire Department's, Street Cleaning Department's and about twenty other stables where large numbers of horses are kept. This has required the use of a five-ton automobile truck, manned by two chauffeurs and six laborers working two shifts of eight hours each per day, which collected about 15,000 cubic yards of manure at a cost of approximately 28 cents per cubic yard for collecting and about 20 cents per cubic yard for purchasing the material at the various stables.

This material has been most valuably used principally on steep side hill surfaces where erosion has taken place, leaving bare the roots of forest trees.

The most important improvement undertaken during the year has been the grading, top soiling and path building of a 20-acre area forming an extension to Patterson Park, as well as the installation of drainage catch basins and their outletting pipe lines, the construction of electric light ducts, manholes and light post foundations, together with the digging of tree pits and filling them with loam to the extent of three cubic yards each.

This work has cost approximately $60,000, leaving for future completion the lawn seeding, the planting of trees and shrubs, the erection of the electric light posts and installation of the lighting cables and post equipment, as well as the surfacing and equipment, with athletic appliances, of the ten-acre athletic field there provided.

Another decided improvement accomplished was the erection of heavy stone retaining walls for the Wyman Park road. The cost of these, with the road supported by them, was about $18,000.

In the old playfield area at Patterson Park, a low-lying section in which there was a ball field has been filled to the extent of about 31,553 cubic yards of earth. This material was furnished to the Park Department without cost. In fact, the Park Department received about $1,000 from contractors for the privilege of depositing material on this area, and at Clifton Park over 50,000 cubic yards of filling material was received, at points requiring the same, by public dumpage.

During the year an average of twenty men were employed in Druid Hill Park in trimming trees and repairing decayed cavities in them, and another gang of men were employed in taking out trees which were crowding the neighboring trees.

In Druid Hill Park the stone-crushing plant at the quarry has run throughout the year, producing over 12,000 cubic yards of crushed stone, which has been used in resurfacing portions of Druid Hill Park.

About 65,000 gallons of liquid tar composition and 35,000 gallons of heavy asphaltic base Mexican oils were used during the year on the surfaces of the roads and paths.

About $5,000 was spent on Green Spring avenue in resurfacing between Druid Hill Park and the Old Pimlico road.

The music court in Druid Hill Park, outside of the brick walk, was surfaced with about five inches of crushed stone and then penetrated with tar, making the entire music court hard surfaced, and surrounding the music court were constructed stationary benches for seating the public.

About 50,000 lineal feet of red cedar was used in constructing railings along the edges of roads where the ground sloped rapidly away from their edges.

A large number of stationary benches were constructed along either side of Swann avenue, between the Madison Avenue Entrance Arch and Washington Statue, as well as along either side of the path paralleling Evergreen Terrace, and also along the paths lying west of Druid Lake.

About 40,000 shrubs were planted in Druid Hill and Wyman Parks.

A new steel flag pole, 110 feet high, was installed at the Madison Avenue Entrance Arch in place of the old wooden pole.

Four new buildings were erected at the zoo—one each for the elk, buffalo, deer and fowl—and a general overhauling and repair of the other buildings at the zoo was accomplished.

The tennis courts and ball grounds in Druid Hill Park were constantly in use from early spring until late fall.

At Ashburton Park a large amount of leveling, seeding and forestry work was accomplished.

At Patterson Park concrete steps were installed in the vicinity of the athletic field house, replacing wooden ones, and four new shower baths were installed in the athletic field house; children's playground areas were resurfaced and a children's garden installed.

An iron fence, replacing a wooden one, was constructed on the north side of the athletic field and also on the north side of the children's playground and new athletic apparatus was installed, and the arrangement of the apparatus in the children's playground improved.

An underground system of electric lighting was extended at Patterson Park.

A high fence surrounding the stable yard was constructed, as well as additional wagon sheds and storage buildings.

The old range of greenhouses for growing bedding stock, located on the Eastern avenue side of Patterson Park, were taken away; one short range was allowed to remain for the use of quoit player's.

About 140 arrests for various offences were made during the year.

Over 2,000 tennis permits were issued and over 130 running track events took place and about fifty soccer and football games were played. The baseball grounds were also in constant use.

At Latrobe Park a large amount of filling and grading was done on its extension and three tennis courts installed there.

The underground system of lighting was extended and 500 watt lights installed.

The wooden flag pole at Riverside Park was taken down, as is was found to be in a dangerous condition.

The extension of the children's playground, the athletic areas and the tennis courts was accomplished and they were all electrically lighted.

At City Springs Square the entire children's playground section was rearranged and its area extended and an underground electric lighting system installed.

The athletic fields, children's playground areas, ball and soccer fields at Carroll Park were all persistently used throughout the spring, fall and summer months.

The running track and infields of the athletic area were resurfaced, as was also the children's playground areas. Roads and paths were also resurfaced and the Monroe street side of the park graded and seeded and a boundary fence and hedge installed.

In order to suppress the dust on the ball fields, 10,000 gallons of oil were used upon their surfaces.

In connection with the ball fields, stationary benches were installed.

At the children's playground a water supply was installed in the buildings, as well as electric light.

The increased use of the athletic fields required the installation of thirty-six additional lockers at the shower bath rooms.

The tennis courts were resurfaced and new backstops erected.

There were over 1,000 permits issued for tennis games, and over 225 baseball games played.

Seventy thousand tender bedding plants were grown in the Carroll Park greenhouses and 100,000 pansy plants for summer bedding in the various parks and squares.

At Gwynn's Falls House of Refuge property a thorough overhauling and repair of the rooms occupied by the caretaker and family was accomplished.

The athletic field area, lying between the Frederick road and Wilkens avenue, was improved, a rustic bridge built across a stream and rustic benches installed.

About forty tons of hay was made and baled in that portion of Gwynn's Falls below Edmondson avenue, and about thirty tons in that portion lying between Edmondson avenue and Windsor Hills.

In Clifton Park the athletic fields, children's playground areas, as well as the ball and soccer field areas, were very largely used.

About 200,000 bedding plants for use in the various parks and squares were grown, together with 100,000 pansies.

Eight new tennis courts were installed, making a total of about thirty courts, which were largely used throughout the season.

In Gwynn's Falls reservation the Department acquired about thirteen acres of additional land, including a large brick house and stable.

The grounds of this property had for years been neglected and these were cleaned and improved, together with the taking down of an old range of greenhouses; an old dilapidated wooden barn and a cottage house with its outbuildings were also removed.

The Gwynn's Falls mill race was persistently used throughout the season by visitors and the trees along the line of this walkway were pruned.

At Mount Vernon Square the display fountains were put in thorough repair.

The Holliday street side of the City Hall was decorated and cared for by the Park Department from early June until frost time.

The Engineering Department was busy throughout the year in making various surveys, plans for construction, supervising the various contracts, looking up property maps and estimate making.

Respectfully submitted,

William S. Manning,
General Superintendent.

Report of the Secretary, 1913

BALTIMORE, January 29, 1914.

To the Honorable Board of Park Commissioners.

GENTLEMEN—I submit herewith my report as Secretary of the Board of Park Commissioners, showing in detail the receipts and disbursements of the Park Department for the year ending December 31, 1913.

Very respectfully,

J. V. KELLY,
Secretary.

Financial Statement

FOR YEAR ENDING DECEMBER 31, 1913.

		Dr.	Cr.
Cash on hand January 1, 1913, made up of accumulated balances as follows:

THIRD ANNUAL REPORT

OF THE

PAVING COMMISSION

To the Mayor and City Council of Baltimore for
the Year Ended December 31, 1913

1797

BALTIMORE
MEYER & THALHEIMER
CITY PRINTER

1914

Paving Commission's Report.

OFFICE OF THE PAVING COMMISSION,
BALTIMORE, MARYLAND.

BALTIMORE, January 1, 1914.

HON. JAMES H. PRESTON, *Mayor.*

DEAR SIR—In accordance with the requirements of Section 1, Chapter 401, Acts of General Assembly of Maryland for the year 1906, the Paving Commission has the honor to make the following report of its operations and transactions for the period embraced from December 31, 1912, to the close of business December 31, 1913.

MEETINGS.

The regular sessions of this Commission are usually held on Wednesdays at 3 P. M. in the Council Chambers. During the year fifty-three sessions were held, at which a quorum was present at fifty-one.

MATERIALS.

The Commission is still adhering to its general policy, as laid down soon after its organization, in paving heavy traffic streets with granite block, medium traffic business streets with vitrified block, and medium traffic residential streets with sheet asphalt and bituminous concrete—all on a concrete foundation. Our recent specifications have, however, been somewhat revised and strengthened for bituminous concrete, in respect to the mineral aggregate, in order to obtain, if possible, a first-class pavement at a minimum figure. Our bids on this material have shown such a slight saving, as between bituminous concrete and sheet asphalt, that the Commission deems it advisable to adhere very closely to the latter material. This is more particularly the case since we have fixed a standard of one and one-half inches of sheet asphalt topping, in conformity with the most up-to-date practice in other cities.

In order to obtain a serviceable pavement at minimum cost in alleys in the residential section where the traffic is limited and concentrated, but only consists of an occasional garbage cart and ice wagon, we are now designing some concrete construction for this purpose and will shortly award a contract for the same. Vitrified block on a four-inch concrete base, as originally designed for these alleys, would cost at least two dollars a square yard, owing principally to the difficulty in handling labor and materials in such contracted spaces. We should be able to obtain first-class concrete construction for about one dollar and twenty-five cents per square yard. The saving would not only consist of this difference, but a considerable amount of grading would also be saved. Should cracks appear in the concrete, which will very likely be the case, they can be cleaned out and poured with bitumen and still render the pavement serviceable.

Most of our exceedingly heavy traffic streets have already been improved, so that undoubtedly there will not be a very large amount of granite block in the future. The amount of vitrified block will also probably be less.

We are still endeavoring to operate in accordance with a general plan and in every section of the city where the improvement of streets would be of a distinct benefit to the public generally. As is well known, however, our operations are limited to those territories where the sewers, both sanitary and storm, have been completed. During the season of 1913 we not only improved streets in the central section of the city, but also in the northwestern, southwestern and southern sections, as well as to a limited extent in the territory east of the Fallsway and north of Fayette street, which latter section has been exceedingly well improved during the two years this Commission has been in operation.

A close examination of our attached map for 1912-13 will show that we have succeeded very well in distributing the improved pavements.

In improving streets in the central section of the city, which were improved thirty-five or forty years ago with old style granite block on sand, we are endeavoring, as far as possible, to put down smooth pavements, such as sheet asphalt and vitrified block. The old granite block taken up is not an entire loss, as they can be redressed, when necessary, and relaid on heavy traffic streets in the freight territories. A few contracts have been let on this basis with apparently economical results, but only time alone will give us accurate results in this direction. Of course, when relaid, they are put on a concrete base with the joints filled with either cement or bitumen and gravel. There is no doubt that a pavement so laid is substantial.

It might be well to state here that while the Commission has abandoned the practice of resurfacing cobble, as explained in our 1912 report, the taking up of cobble is not an entire loss, as the contractors are required to allow the city a figure for this old material, which amounts to anywhere from one cent to twenty cents a square yard. Wherever possible the contractors have been allowed to install crushers with the privilege of crushing this material and using it for the concrete base.

We have given the street railway construction in this city considerable study. We are now considering the situation very carefully with the view of recommending, possibly, some legislation compelling the railway companies to install concrete under and around their ties, which practice is being pursued in nearly all up-to-date municipalities, as can be substantiated by authorities.

Our street railway construction is now on ballast under the ties, with concrete between and over them as a base for the paving. The paving over such construction may look very well for the first few years, but the strain of the heavy equipment which is now being operated by the street railway companies, and ever on the increase from year to year, will undoubtedly produce such vibration as to cause the pavement to loosen and go to pieces adjacent to the rails. In our judgment, therefore, this matter requires the most urgent and close study.

Cost Figures, Engineering and Inspection.

We still believe that a close examination of our contract figures will show that Baltimore is laying pavements in as economical a manner as any other city in the United States, consistent, of course, with good work, and in this connection we respectfully refer you to Table A, showing the average unit prices paid during the year. A comparison of the 1913 table with that of 1912 will show a slight increase, particularly in granite block and vitrified block. This slight increase is probably due to the fact that our inspection is closer and more in detail.

It must be realized that starting a $10,000,000 paving proposition in the City of Baltimore is a very extensive undertaking. It is true that some of our engineers and inspectors at the beginning of the work may have been somewhat inexperienced, necessitated by the fact that previous to 1912 no paving of such magnitude had ever been carried on in this city; and, therefore, enough experienced men to carry on the proposition could not be secured in Baltimore at that time, particularly when you stop to consider all of the vast engineering undertakings the city had and still has on hand. All of these men were selected for merit only and we now have a good organization. As time went on they became more experienced, were able to

*The bid of $3.50 on Contract No. 16 was not used in figuring this item, as it was evidently an error on the part of the bidder.

†The bid of 28 cents on Contract No. 75 was not used in figuring this item, as this bid was for a large quantity of heavy grading.

make a stricter inspection and, therefore, turn out a correspondingly amount of better workmanship.

One of the first acts of the Commission was to select from the City Engineer's office engineers and inspectors of experience, who had been in the service of the city for a number of years, as a nucleus around which we could gather and organize an expert corps. We believe that we have succeeded in doing this and as time goes on and our paving plan advances they should become more expert in their work and, therefore, produce even better results.

Washington City is probably the best paved one in the United States. Detroit, Mich., is probably ranked as second. The inspection system of the former is thirty-five years old, and that of the latter ten years old. To substantiate this I quote the following from A. W. Dow's report to the Paving Commission under date of April 30, 1913:

> In comparison with the work done in other cities, your work is far above the average. The inspection systems in other cities are much older. The inspection system in Detroit is ten years old, and in Washington, D. C., it has been in existence since 1876, and the contractors there know what is expected by those cities and the inspectors are all trained now in the work. Detroit and Washington come first, and Baltimore would come near third.

During an investigation last spring nothing startling developed, although the work of a few contractors was found to be a little under the specifications in some cases. In each case, however, an amount of money equal to the shortage was deducted from the respective contractors' estimates, the city losing absolutely nothing.

Our plant inspection was fully described in the 1912 report. The system is practically the same, so that we see no reason for repeating an outline of it.

Contracts to the number of thirty-one were awarded during the year, a total of seventy-three from the inception of the Commission's work to December 31, 1913. The 1913 contracts run from $5,712 to $132,886 in order to attract bidders of both large and small capital, which is the usual policy of the Commission.

We are attaching Table B, showing the amount of work completed during 1912 and 1913 and the amount of work left uncompleted which was contracted for during these years. This table also shows the total yardage contracted for from the inception of the Commission to January 1, 1914. It includes contracts to the amount of $2,601,793.28, which have been contracted for since the inception of the Commission. Of this amount contracts to the value of $356,120.56 remain uncompleted on December 31, 1913, and are, therefore, carried over to the year 1914.

DISBURSEMENTS.

Our disbursements for the year are explained in the attached statements, which have been checked by the City Comptroller. That official has also been furnished with a more detailed statement showing disbursements during the year, and all accounts have been audited by the Baltimore Audit Company to the close of business December 31, 1913.

You will note that a total of $1,527,653.79 was expended during the year 1913. Taking into consideration, however, our December estimates, which were paid in 1914, and the retained percentages on the 1913 work, which will be paid in 1914, less December, 1912, estimates and retained percentages on 1912 work paid in 1913, the financial value of the work done during the current year was $1,378,678.07. The cost of engineering, surveys and inspection during the year was 4 per cent. of this amount. This includes considerable advance work of surveys and plans for 1914 work.

Again, taking into consideration all overhead expenses for 1913, such as administrative salaries, construction salaries, testing material, incidental expenses, including the four clerks in

NOTE Where it was planned to lay sheet asphalt and bituminous [illegible] over the cobble surface, it was found necessary to remove a large portion of this cobble and replace with a concrete base This concrete was paid for by the cubic yard

the Appeal Tax Court for collecting the paving tax, these expenses to date amount to 5.59 per cent. of the total amount of work done. This includes the amount paid per diem inspectors during the year, but which was charged to improved paving, as per financial statement. All overhead expenses from the inception of the Commission's work to December 31, 1913, amount to 5.35 per cent. of the total value of work done.

Attached herewith are: Table No. 1, showing the personnel of the Administrative Department; Table No. 2, showing the personnel of the Engineering Department; Table No. 3, showing statement of contracts awarded, status of work, areas of work and all necessary information relating thereto; Table No. 4, showing mileage and areas of all pavements in the city, corrected to December 31, 1913; also map showing streets paved with improved paving to December 31, 1913.

Respectfully submitted,

R. KEITH COMPTON,
Chairman and Consulting Engineer.

JAMES H. PRESTON,
Mayor, Ex officio.

DOUGLAS H. THOMAS,
ALFRED E. BOOTH,
LEONIDAS G. TURNER,
SAMUEL C. ROWLAND,

J. MYERS HEDIAN, *Secretary.*

Financial Statement.

Appropriations and Expenses for the Year 1913.

Appropriation, administrative salaries	$11,180 00
Total expenditures	11,068 54
Surplus of credit	$111 46
Balance to 1951 Loan	111 46

Appropriation, construction salaries	$52,600 00
Total expenditures	51,915 47
Surplus of credit	$684 53
Balance to 1951 Loan	684 53

Appropriation, expenses		$1,900 00

Expenditures.

Stamps and postal cards	$100 34	
Printing and stationery supplies	257 99	
Bond of bookkeeper ($3,000)	7 50	
Office furniture	266 50	
Telegrams, express charges and newspapers	24 02	
Subscriptions to periodicals	4 50	
Telephone rental and toll messages	62 21	
Affidavits	95	
Expenses of inspection trips	59 00	
Maps	25 75	
Directory	7 00	
Service of temporary stenographer	16 00	
Total		831 76
Surplus of credit		$1,068 24
Balance to 1951 Loan		1,068 24

Appropriation, testing materials		$10,000 00

EXPENDITURES.

Salaries	$3,433 30	
Municipal Laboratory—Sheet asphalt and bituminous concrete inspections, including equipment for laboratory	6,537 24	
Total		9,970 54
Surplus of credit		$29 46
Balance to 1951 Loan		29 46

Appropriation, improved paving	$924,320 00
Amount brought forward from 1912	830,133 60
Amount received from other sources, per statement to City Comptroller	43,270 48
Received account special paving tax (1913)	62,317 76
Total credits	$1,860,041 84

EXPENDITURES.

TABLE No. 1.

PERSONNEL OF ADMINISTRATIVE DEPARTMENT.

NAME.	Title.	Appointed.	REMARKS.
R. Keith Compton	*Chairman	May 31, 1911.	
James H. Preston	Mayor	....	Ex officio.
Douglas H. Thomas	Commissioner	May 31, 1911.	
Alfred E. Booth	Commissioner	May 31, 1911.	
Leonidas G. Turner	Commissioner	May 31, 1911.	
Samuel C. Rowland	Commissioner	May 31, 1911.	
J. Myers Hedian	Secretary	March 7, 1912.	
William F. Gies	Stenographer	March 15, 1912.	
W. Irving Bowie	Bookkeeper	February 26, 1913.	
Ignatius E. McKenna	File Clerk	September 16, 1912.	

*Appointed Consulting Engineer, June 27, 1913. (See personnel of Engineering Department.)

TABLE No. 2.

PERSONNEL OF ENGINEERING DEPARTMENT.

NAME.	Title.	Entered Service.	REMARKS.
R. Keith Compton	Consulting Engineer.	June 27, 1913	
L. J. Houston, Jr	Principal Assistant Engineer	January 15, 1912	Resigned February 1, 1913.
R. M. Cooksey	Principal Assistant Engineer	November 16, 1911	Promoted from Assistant Engineer, February 1, 1913.
Bruce Aldrich	Chief Asphalt Inspector	March 1, 1912	
F. K. Duncan	Assistant Engineer	November 16, 1911	
C. P. Nolan, Jr	Assistant Engineer	February 2, 1912	
B. L. Crozier	Assistant Engineer	July 18, 1912	
P. C. Painter	Assistant Engineer	June 12, 1912	
W. H. Smith	Assistant Engineer	June 1, 1912	
H. D. Williar, Jr	Assistant Engineer	April 22, 1912	
C. E. Bennett	Inspector	May 13, 1912	Died June 15, 1913.
William E. Bowles	Inspector	July 18, 1912	Furloughed January 5, 1913.
William T. Brewer	Inspector	August 22, 1912	
Harry C. Buckley	Inspector	September 30, 1912	Promoted from Rodman, January 1, 1913.
George P. Camalier	Inspector	December 5, 1911	
James R. Carroll	Inspector	November 26, 1912	
Robert A. Chambers	Inspector	August 26, 1912	
John J. Collins	Inspector	May 19, 1913	
Laurence Cotter	Inspector	December 16, 1912	Furloughed January 5, 1913.
Edward G. Cox	Inspector	August 7, 1913	

Thomas Davidson	Inspector	June 1, 1912	Promoted from Rodman, January 1, 1913.
Samuel Dinnis	Inspector	July 13, 1912	
John W. Farrell	Inspector	November 13, 1912	
George E. Finck	Inspector	November 16, 1911	Promoted from Draughtsman, March 16, 1913.
Robert A. Fisher	Inspector	September 9, 1912	Resigned April 15, 1913.
John J. Gallagher	Inspector	August 3, 1912	
Benjamin Grymes	Inspector	May 23, 1912	
B. H. Hanson	Inspector	May 20, 1912	Promoted from Rodman, April 1, 1913.
M. G. Harris	Inspector	May 7, 1913	
N. U. Hasson	Inspector	April 25, 1912	
F. J. Hayden	Inspector	June 3, 1912	
Lee E. Hedrick	Inspector	May 24, 1913	
Thomas Hines, Jr	Inspector	May 7, 1913	
Reginald G. Hobbs	Inspector	July 6, 1912	Promoted from Rodman, January 1, 1913.
William Hunt	Inspector	August 23, 1912	
Charles H. Kirby	Inspector	July 18, 1912	
William King	Inspector	October 28, 1912	
A. C. Knight	Inspector	November 17, 1911	
James H. McAfee	Inspector	May 10, 1913	
T. Harry Magee	Inspector	September 5, 1912	
Lewis Macher	Inspector	October 1, 1912	Furloughed January 15, 1913.
Pierce Marston	Inspector	August 15, 1912	
Leroy P. Mayes	Inspector	August 9, 1912	
James E. Murphy	Inspector	June 17, 1912	
John A. Murphy	Inspector	September 1, 1912	
Patrick Norton	Inspector	May 13, 1912	
William C. O'Keefe	Inspector	May 2, 1912	Furloughed November 26, 1913.
William A. O'Neill	Inspector	July 17, 1912	Relieved of duty November 1, 1913.

TABLE No. 2—*Continued.*

Personnel of Engineering Department.

Name.	Title.	Entered Service.	Remarks.
J. C. Parkinson	Inspector	November 1, 1912	
Walter F. Perkins	Inspector	July 27, 1912	Promoted from Rodman, June 11, 1913.
Samuel A. Pitt	Inspector	June 2, 1913	
David D. Porter	Inspector	April 1, 1913	Resigned June 1, 1913.
Edward B. Rebbert	Inspector	May 16, 1913	
Evan V. Rinehart	Inspector	July 1, 1912	Resigned February 1, 1913.
Irving M. Scott	Inspector	October 2, 1912	
J. C. Shryock	Inspector	May 13, 1912	
Arthur J. Smith	Inspector	October 16, 1912	Promoted from Sub-Inspector, May 1, 1913.
Henry M. Staylor	Inspector	September 16, 1912	
Joseph W. Thomas	Inspector	September 1, 1912	
John Thorne	Inspector	April 10, 1913	
John E. Ward	Inspector	June 17, 1912	Relieved of duty May 14, 1913.
William B. Waterman	Inspector	November 18, 1912	
Ambrose M. White	Inspector	October 9, 1912	
Albert Whiteley	Inspector	October 10, 1912	Promoted from Rodman, January 1, 1913.
William M. Youse	Inspector	October 17, 1912	
J. B. Brinton	Sub-Inspector	April 15, 1913	Resigned July 8, 1913.
Alan L. Campbell	Sub-Inspector	June 2, 1913	Furloughed November 5, 1913.
J. A. Schiavetti	Sub-Inspector	April 28, 1913	Resigned August 1, 1913.
Julian D. Sears	Sub-Inspector	May 28, 1913	Furloughed October 7, 1913.
William F. Gunkel	Rodman	November 4, 1912	

A. N. Satterfield	Rodman	July 31, 1912	
Guy Stollenwerck	Rodman	June 3, 1913	Furloughed October 1, 1913.
Paul V. Burwell	Draughtsman	August 20, 1913	
C. D. Clark	Draughtsman	November 25, 1912	Resigned May 1, 1913.
Charles S. Distefano	Draughtsman	July 27, 1912	Resigned January 1, 1913.
E. J. McIntyre	Draughtsman	October 9, 1912	Resigned January 10, 1913.
Roland G. Spedden	Draughtsman	May 2, 1913	
Ernest M. Will	Draughtsman	May 2, 1913	Resigned August 19, 1913.
Gustav J. Barrett	Stenog'r and Clerk	February 1, 1913	Transferred to Inspector, April 1, 1913; resigned May 15, 1913.
George M. Dersch	Stenog'r and Clerk	November 16, 1911	Resigned February 1, 1913.
Florence Solomon	Stenog'r and Clerk	April 1, 1913

EXPLANATORY REMARKS:

[1] For average prices see Table A; for recapitulation of lengths and areas, see Table B
[2] The price for these wood block liners was included in the bid for sheet asphalt paving
[3] Old granite block repaved as taken from the streets
[4] Old granite block reeled before being repaved.
[5] Bituminous concrete paving laid and sealing coat applied.
[6] Cement concrete was laid by the Eastern Cement Gun Company over the old cobble surface before the bituminous concrete paving was laid
[7] This paving was laid in front of the Western Maryland Railway Company's freight shed and oil house between the curb and building lines.
[8] This paving was laid in front of the Industrial Building, between the curb and building lines.
[9] Old granite block redressed before being repaved.
[10] Bituminous concrete paving laid without applying a paint coat or a sealing coat.
[11] By agreement half the cost of paving this street was borne by the City Engineer's Department.

TABLE No. 4.

GENERAL INFORMATION (Compiled by City Engineer's Department).

The total mileage and area of paved and unpaved streets and alleys in the City of Baltimore, corrected to December 31, 1913, is as follows:

NOTE—The classification here made is: Where the thoroughfare is paved and curbed and footways provided it is called a street, regardless of its width. All thoroughfares twenty (20) feet wide and under, which are not curbed, paved and provided with sidewalks, are classed as alleys.

The above table does not include any work of the State Roads Commission, Annex Commission or of this Department for which contracts have been entered into and remain uncompleted December 31, 1913.

This table is based on work done during the year by the City Engineer's Department, the Annex Commission, State Roads Commission and the Paving Commission.

NINETEENTH ANNUAL REPORT

OF THE

FREE PUBLIC BATH COMMISSION

BALTIMORE, January 1, 1914.

TO THE HON. JAMES H. PRESTON, *Mayor:*

DEAR SIR—The Free Public Bath Commission, to whom is entrusted the care of the public baths, public laundries and public comfort stations, beg to report as follows:

Each year your Commission has served has recorded increase in facilities, increase in patronage, and increase in public favor at home and abroad.

The year just closed has been especially noteworthy. One of the superintendents of the New York Associated Charities has recently written the following words of appreciation after he had received several letters about our public baths and laundries:

"Your city is a continuous store of information and must pay the penalty for being a laboratory of advanced experimentation in public facilities."

The Commission desire to express here also their appreciation of your personal interest and co-operation in the growth and advancement of our work throughout the city.

COMPARATIVE SUMMARY OF PATRONAGE FOR 1912-1913.

Baths.	1912.	1913.
Walters Baths No. 1, South High Street	248,145	243,672
Walters Baths No. 2, Columbia Avenue	113,473	116,225
Walters Baths No. 3, Argyle Avenue	34,737	35,334
Walters Baths No. 4, West and Marshall Streets	80,412	83,405
Greenmount Avenue Baths—Open 3⅓ months in 1912	15,805	88,184
West Park Recreation Center, Hampden	38,279	44,184
Patterson Park Indoor Showers and Lockers	64,360	60,438
Patterson Park Swimming Pool	120,848	159,022
Four Portable Baths in various locations	58,472	75,398
Three Outdoor Baths; Winans, Locust Point and Gwynn's Falls	117,053	142,947
Total patrons	891,584	1,048,809
Public Comfort Stations.		
Patrons at Market Place	440,429	576,138
Patrons at Greenmount Avenue	63,031	286,875
	503,460	863,013
Total attendance	1,395,044	1,911,822

From the above summary, it will be seen that the indoor shower-baths were used by 746,840 patrons, an increase of 92,000 over the previous year; and the outdoor swimming baths recorded 301,969 patrons, an increase of 64,000 over 1912.

This grand total of 1,048,809 patrons represents large benefits to many classes of the community.

1. To the poor, living in the congested sections, who find in the baths an opportunity for health and cleanliness convenient to their homes.

2. To other thousands who use the public laundries where for a few cents the family washing, drying and ironing may be done outside the cramped quarters of their rooms.

3. Another class is the 300,000 patrons of the outdoor swimming baths, which furnish clean and wholesome recreation in the beautiful public parks or at the harbor's edge.

4. A fourth division of our work is represented by the baths at two athletic recreative centers, where in 1913, 104,000 patrons were recorded.

These two houses are Patterson Park Field House in the extreme eastern section of the city, and West Park Recreation Center in the northern section.

5. Another department of municipal work, under the care of the Public Bath Commission, is scarcely less important than any of the other four, i. e., the public comfort stations.

By a fairly accurate count, 863,000 persons used the two convenience stations last year, one at Market Place and Lombard street, and one at Greenmount and Harford avenues, near Belair Market.

RECEIPTS FROM FEES.

It is gratifying also to report the increasing amounts received year by year from fees paid by patrons who use the various conveniences managed by the Public Bath Commission.

The five classes above mentioned returned fees amounting as follows, which have been returned to the city treasury:

1. Indoor Baths open all the year	$15,792 50
2. Outdoor Baths for summer recreation	2,640 73
3. Public Laundries	1,509 82
4. Recreation Centers	1,350 48
5. Public Comfort Stations	923 76
6. Sale of old material	12 55
	$22,229 84

These receipts show an increase of $3,304.06 over the amount received in 1912.

THE INDOOR BATHS.

The number of patrons of the indoor baths amounted to 746,840, about three-fourths of the total bath patronage, and from a sanitary standpoint these form the most important feature of our municipal service.

They are made up of all classes, young and old: crowds of working men and women; many children from the schools or from the streets; students who live in the city temporarily: seafaring men from the neighboring harbor, the floating population of our city; young men and women of athletic clubs. pupils of public and other schools, all these find cleanliness and comfort, and we may say, better manhood and womanhood in the use of the bath facilities.

These ten bathhouses in operation in the city during summer have sometimes counted 6,000 or 7,000 patrons in a single day, and for the entire year the total of 723,000 show an increase of 92,000 over the year 1912.

It was expected with the increase in number of these bathhouses and with the extension of the sewerage system and a more general installation of bath tubs in homes, that here and there a slight decrease of patronage would result, but this has not been the case.

The first Walters bath opened in 1900 on South High street had a patronage last year of 243,672, but a few thousand less than its maximum for several years past, and at all the other houses there have been increases of patronage over 1912 as follows:

Walters No. 2, Columbia avenue	2,752
Walters No. 3, Argyle avenue (colored)	597
Walters No. 4, West and Marshall streets	2,993
Greenmount avenue, first full year	73,000
Four Portable Baths	16,926

This is an indication that the public need of cleansing baths has not yet been entirely met, and especially in such old settled parts of town as the Fell's Point section, where two small portable baths located there have had during 1913, 59,930 patrons.

THE OUTDOOR SWIMMING BATHS.

The three original sites occupied by our baths at the harbor's edge have now been purchased for commercial uses, and in a year or two we shall be obliged to vacate entirely the harbor sites. Through the kindness of Mr. Colin McLean, we expect to occupy the Locust Point shore south of Latrobe Park for this season.

It is hoped to obtain a portion of the beach at Fort McHenry when this becomes a public park, and there to establish a large swimming beach; this commanding site between the two rivers makes it an ideal location.

The continued advance of commercial interests in the harbor render it necessary to provide bathing and swimming as a clean and sanitary recreation in public parks. Our city has in this regard been in advance of many American cities. Patterson Park in the eastern section and Gwynn's Falls in the southwestern section show by their records of bathers for last season how highly the public appreciate it. There were 205,000 patrons at the two stations.

SWIMMING BATHS FOR COLORED YOUTHS.

There is no provision made for this form of bathing among the colored youth of our city, and the Bath Commission believe that a small concrete pool could be established in the large open yard in the rear of Walters Bath No. 3, on Argyle avenue. This would supply to 20,000 or more colored school children of Baltimore an opportunity for summer swimming.

THE PUBLIC LAUNDRY.

Since the first opening of our permanent indoor baths in 1900, the Baltimore Bath Commission have maintained public laundries for the use of families where facilities for washing clothes were inadequate. This feature of our service has accommodated during the past fourteen years about 140,000 persons who have come from homes where washing facilities are meagre.

This annual patronage, now about 22,500 in number, is composed of three classes. The largest class consists of 8,500 colored women who use the Argyle Avenue Bath House for their family wash. These colored women live in alleys, in crowded tenements in the larger streets, or work as servants, and appreciate the privilege of coming to our laundry, where for a few cents they obtain hot water, the use of tubs, wringers, driers and irons. The patrons, old and young, are typical of the colored population in Baltimore; they are house servants, wives of laboring men, and others, and to no class do the public laundry facilities bring more advantages than to these colored women.

The next largest class who patronize our laundries are the 7,000 or 7,500 women who use the facilities at the three Walters baths on South High street, on Columbia avenue, West and Marshall streets, and Greenmount Avenue Baths. These are all white women from humble homes, chiefly wives of laboring men.

The third class of laundry patrons are the men, 5,000 to 6,000 annually, who wash their own clothing in the laundry at Walters baths on South High street. In some ways this is the most needy class who visit our houses; like the Coolies of India, they carry all their worldly possessions on their persons. At a cost of six cents, or in many cases entirely free, these men, the floating population of city life, get a bath, spend an hour in the laundry washing and drying their underclothing, and walk out again refreshed and clean.

A recent article on public laundry and housing conditions appeared in *The American City*, a New York periodical, and our Baltimore public laundries received high commendation from the writer.

He said, speaking of laundries:

"There about fifteen such institutions in America, five of which, and by far the best of them, are in Baltimore, Md."

Dr. Donald B. Armstrong, the writer of the article, includes in it two photographs of our Baltimore laundries, and he closes with these strong words as a plea for the establishment of similar places in New York city:

"The public washhouse, like the public baths, finds its chief justification in the fact that it gives to the people an opportunity to learn how to be clean and make it possible for them to appreciate the value of health and decency in being physically clean. Physical cleanliness enhances their moral and spiritual tone. They will recognize more acutely their housing defects and will demand even more energetically than at present that equipment for the home which they have learned to use and value outside and the importance of which, for the preservation of health and the maintenance of decency, they have been educated to appreciate."

Baltimore Baths As Models.

From many parts of the United States and Canada, inquiries have come to us asking about the proper construction of swimming pools, the best methods of maintenance, how to arouse popular interest in the establishment of public baths, etc. Such letters have come from New York, Plainfield and Montclair, N. J.; Fall River, Mass.; Delaware, Ohio; Belvedere, Ill.; South Bend, Wis.; Los Angeles, Cal.; Toronto and Brockville, Canada.

A recent note from Tientsin, China, to our vice-chairman, Mr. William H. Morriss, asks the plans of one of our Baltimore baths for use in the erection of similar establishment there. "Something of this kind," says the writer, "is a great need here, for the people are so poor and the houses so small that it is useless to preach personal cleanliness to a great many of them, because they have no place where they could get a bath if they wanted it. I think no better form of social service could be done than to introduce something of the type that you and others have in Baltimore in these bathhouses."

Our economy of management of baths and laundries, our freedom from political or personal influences in making appointments of employees, our careful sanitary regulations as to cleanliness, and withal, the large success resulting, have given our city a national reputation in this department.

Baltimore is glad also to have inaugurated the National Association for the Promotion of Hygiene and Public Baths, which held its second annual convention in this city in May, 1913. There were in attendance 35 delegates representing many American cities.

Meetings were held in the Council Chamber of the City Hall and at McCoy Hall, Johns Hopkins University. Mayor Preston greeted the delegates with a cordial address of welcome, and during the three days addresses were made and discussions were held on subjects connected with sanitation and public baths.

Among the subjects treated were "The Filtration of Water Used in Swimming Pools," "Proper Materials for Construction of Bath Houses," "The Need of Baths in Large Cities," "The Relation Between Public Parks and Athletics and Swimming Baths," "The Unsanitary Conditions of the Negro Life in Large Cities."

The interest aroused by such meetings in various cities where the conventions are held will doubtless result in the establishment or extension of the public baths there. The next meeting of this convention will be held in Newark, N. J., in May, 1914.

Recreation and Field Houses.

In close association with the work of our baths, the Commission at present maintain, or co-operate in the management of three recreation houses. One of these is at the Patterson

Park Field House, a center of athletic sports and games and playground interest, where in 1913, in addition to the 159,000 bathers, 60,438 persons used the lockers and shower-baths.

The second is at Hampden, where at the West Park Recreation Center we employ two attendants for the public baths there. During 1913 there were 44,202 bathers here, of whom one-third were connected with the Public Athletic League and other athletic associations.

At Gwynn's Falls Park a new field house was erected last spring, containing eight shower-baths and 60 lockers for use of athletics, baseball players, tennis players and others who use the playgrounds of the park.

Forty-three thousand three hundred and twenty-eight men and boys and 3,494 women and girls were patrons here during the swimming season, although the second pool and accommodations for women and girls were not open until July 21.

During the past five years the development of athletics under the Public Athletic League, the wider interest in public sports, baseball, football, etc., have made the parks more and more the resort of thousands of young people; shower-baths and swimming pools are among the chief attractions to these thousands; one of the best results of this clean and healthy outdoor recreation for school children and others is their better physical strength and love of outdoor life.

SAFETY FOR BATHERS.

The Commission is glad to report that, notwithstanding the more than a million bath patrons during 1913, no drownings nor serious accident has occurred. In so large a number there are usually some reckless bathers, and only the watchfulness of our efficient guards has prevented accidents.

Probably fifty rescues have been made at the outdoor swimming beaches during the season.

It is more evident each year that parents appreciate the safeguards thrown around outdoor bathing by our Commission, for many thousands of our patrons consist of small boys and girls over whom special watchfulness is needed.

INSTRUCTION IN SWIMMING.

During the season of 1913, two swimming teachers were engaged—Mr. A. S. Lowsley for boys and men, and Miss Margaret Michael for women and girls.

The result of their season's work is summarized by the statement that 1,173 beginners were taught to swim at the bathing stations, of whom 184 are women and girls. During the past four seasons, about 4,000 persons have been taught the useful art of swimming by our instructors; besides this, instruction has also been given in various swimming strokes and diving.

LECTURES ON PUBLIC BATHS.

For a number of years past, members of the Bath Commission have delivered illustrated lectures on public baths in Europe and America, before improvement associations, church clubs, health conventions and similar gatherings in this city and elsewhere.

In these lectures the chairman, Mr. Levering and Messrs. Morriss and Eisenbrandt, Dr. Gichner and the Secretary have taken part. Recently, the Commission has had a part also in the courses of lectures delivered by members of city departments.

These lectures are a valuable advertisement of the work of the Bath Commission, and have helped to enlighten the public as to its scope and character.

PUBLIC COMFORT STATIONS.

Most American cities were slow in establishing public comfort stations; several large cities have as yet made no such provision for the public. The first one in our city was opened in April, 1908, at Market Place and Lombard street.

In September, 1912, a second house was opened at Greenmount and Harford avenues, near Belair Market. Both of them were used by many thousands this past year, nearly a million in all, and they have proven themselves here, as in other cities, especially European cities, a necessary municipal provision for sanitation and comfort.

The Commission is glad to report its co-operation with the Comptroller and Inspector of Buildings in the erection of a third comfort station at the Lexington Market. This neighborhood is one of the most frequented in the city, and doubtless the house to be erected there will prove the most widely used of any thus far erected.

Mr. Thomas C. Kennedy, the architect, furnishes the following description of the new building, Lexington Market Public Comfort Station:

The plans and specifications for this building are now complete and bids for its erection are about to be advertised. The location is the northwest corner of Louisiana avenue and Jasper street, on a lot 22 feet by 60 feet, which will be entirely covered by the new building. Whilst the lot is admirably situated for neighborhood and market people's convenience, it required much study to obtain the greatest amount of accommodation with proper lighting, complicated by the different separate entrances needed, which in this case are increased by the need of an entrance to the market master's office.

As arranged, the women are accommodated at one end of the building, the men at the other, with the market master's office on the second floor, reached by an entrance in the middle.

An improvement in the accommodation afforded by these stations has been effected by dividing both men's and women's rooms so as to provide separately for white and colored, and this has been arranged so that the attendant directly supervises all, without increasing the number of the attendants.

Three free toilets are provided for white women, and two for colored; twelve for white men, and four for colored, and one pay toilet for white women, and three for white men.

Twelve urinals and four free lavatories are provided for white men, four urinals and one free lavatory for colored men, and one free lavatory for white women, and one for colored women.

The interior arrangement combines the most strictly sanitary materials, free from ornamentations, but naturally superior in appearance. All walls are lined with high wainscoting of Mar-Villa marble, a home production from the Beaver Dam quarries, but recently worked, and all stall divisions are of the same material. The porcelain work will be Vitro-China, absolutely impervious and many times stronger than the ordinary porcelain, and the various fixtures will be the best of the latest improvements.

The walls above the marble will be enamelled. The main rooms are lofty, fourteen feet high, and have in addition to the high windows on all free exposures, large skylights with monitor windows opening on the sides.

A certain proportion of indirect radiation, in addition to the direct, assists in ventilation when windows are closed.

A restroom with cot is provided in connection with the female attendant's room.

The steam heating and water heating equipment, with fuel and general storage, are placed in the cellar, and additional storage, together with the market master's office, is placed in the second story, which only covers the south end of the building.

Exteriorly, the aim has been to erect a building which would not be suggestive of an ordinary business structure, but would rather indicate, though not too aggressively, its true purposes.

An Italian treatment has been adopted, using a texture brick with a very liberal trimming of ornamental stone work, the material proposed for which is a concrete stone manufactured in New Haven. The beauty and desirability of this material may be gathered from the fact that Mr. Goodhue (the architect of the proposed Protestant Episcopal Cathedral in Baltimore) and his partner, Mr. Ralph Cram, who have designed so many of the greatest cathedral and other large buildings through the country, have used and continue to use it in much of their best work, both interiorly and exteriorly and the government has approved its use at West Point, the Panama Zone buildings, etc.

RECOMMENDATIONS.

The Commission desires to add these recommendations for the furtherance of their work, several of which were made in last year's annual report:

First—A municipal bath, similar to Walters baths, at or near Broadway Market; this should be equipped with comfort station facilities. We regard this as of first importance, and recommend that this be the next development.

Second—An indoor swimming bath, to be conducted in the neighborhood of No. 1 Bath on South High street. This will be a new development, but we are convinced will be a great boon to that congested neighborhood, where no recreative facilities are available.

Third—The Commission urges the acquisition of a suitable strip of the natural beach on the south side of Fort McHenry, where recreative swimming baths can be permanently established.

Fourth—The development of an open-air swimming bath in the northern or northwestern section of the city.

Fifth—The erection of a public comfort station in the neighborhood of Light Street Wharf, one of the most congested sections in our city.

CO-OPERATION WITH OTHER CITY DEPARTMENTS.

Courtesies have been extended to our Commission by other city departments to whom our thanks are due, especially to the Board of Park Commissioners, the Police Department, the Water Engineer, the Topographical Survey Commission and the Inspector of Buildings.

The statistical tables for 1913 are appended.

(Signed) EUGENE LEVERING,
President Free Public Bath Commission.

JAMES P. KANE
Southern District.

REPORT.

Department of Public Safety,

Office of the Commissioner of Street Cleaning,

City Hall,

Baltimore, December 31, 1913.

Hon. James H. Preston, *Mayor*.

It is with pleasure that I herewith submit the work of the Street Cleaning Department during the fiscal year 1913.

I feel that the Department has good reasons for feeling proud of itself. It has performed a large ratio of public service, larger than has ever been performed in the history of the Department; and it has performed that service with an appropriation no larger than the one granted for use of the Department two years ago.

When we stop to consider how large a volume of additional work has been piled upon this Department as the result of the big public improvements of the past two years, and when we remember that the city itself, in its natural building development, has multiplied buildings, thereby largely increasing this Department's responsibilities, you can well understand how gratified we feel when we realize that we have closed the year with satisfactory work, and that too without having to call upon the taxpayers for a single penny of additional appropriation. On the contrary, it is our pleasure to announce that we return to the city at the end of 1913 a neat surplus of $71,902.55.

Before going into the details of my report, I want, in a few words, to tell you that I enjoy at the present time the consciousness of knowing that the efficiency of my Department is on the advance. I have a splendid lot of men under me. Those holding the higher positions are quick, active, diligent and loyal. They realize the object towards which I am working, and they are sincerely assisting me in the achievement of that end. The general type of the men holding the lower positions is of a most encouraging average. That is why the Department is able to do so big a volume of work at so low a cost to the city. The public owes far more to the humble street sweeper than the average citizen seems to realize.

THE VOLUME OF THE YEAR'S WORK IS FAR IN EXCESS OF THE YEAR PRECEDING.

More machine sweeping was done during the past year; more washing machine work done on improved pavements; greater amount of garbage and ashes collected, necessitated by the erection of 2,375 new dwellings during the year; more sewers cleaned and debris hauled from the same; additional work of cleaning the markets since September 1. All of this work was accomplished without extra compensation, and was accomplished entirely within the regular appropriation made for the year, which appropriation was the same as that for the year 1912.

FIRST CITY TO USE A GARBAGE AUTOMOBILE TRUCK.

The Board of Estimates authorized the purchase of a 7½-ton auto garbage truck. The truck is the first to be purchased in any city. The truck cost $5,034. It was delivered and put in service last May. It has been thoroughly tested because it was used during the summer of heavy garbage season to receive garbage that had been collected in carts from the householders at 9 and 11 A.M., 1 and 3 P.M. Twenty-four carts, in relays of six, at the hours mentioned above, hauled their loads to the Western Stable, drove in on the main floor, and by means of a sanitary steel chute, dumped their contents into the truck. The truck is water-tight and is kept well covered. The truck was then hurried off to the garbage scow at Back Basin, emptied and returned at regular intervals for other loads. By this means an average drive of five miles was saved for each load made by the above mentioned carts. Heretofore, garbage collected in Forest Park, Walbrook and the extreme northwestern section of the city had to be hauled to the scow at Spring Garden.

The auto garbage truck is also being used at the Lexington and Belair markets on Saturday night, taking the place of twelve street carts for a half day each. This practice enables us to utilize these carts in the work of taking up dirt from the streets and alleys.

The cost of operating the truck per day has been estimated at about five dollars. That represents a saving to the street cleaning as well as the garbage service. It has all been effected by a systematic operation of the truck.

The garbage routes are being constantly increased by the erection of new dwellings. By the use of the truck, however, the collectors have a shorter haul and have been able to make the increased collections; and that, too, without having the expense of putting out additional garbage teams. Horses too have been saved a long drive during the summer months.

MARKETMEN ARE PLEASED WITH THIS DEPARTMENT'S HANDLING OF THE MARKETS.

By an order issued by the Board of Estimates, the Department on September 1 took charge of the sweeping and hosing of the various market sheds. The markets are now hosed daily, weather permitting. It addition to the hosing, a sweeper in white uniform is always in attendance during the market sessions, going about gathering up the litter and rubbish on the footways in the market sheds. This innovation has been the source of much favorable comment from stall owners as well as from the general public who patronize the markets.

RECEPTACLES FOR RUBBISH AT THE MARKETS.

After taking over the cleaning of the markets on September 1, the Department purchased eighty wire cages, placing them at different points on the curb line of the various markets for depositing paper and litter collected in and about the market sheds. This has been an incentive for the stall owners themselves to keep the markets clean, paper and rubbish being deposited in the cages to be taken away by the Department carts after market hours.

During the year the Department also purchased about one hundred additional waste paper receptacles for street corners over town, into which the passing public could cast fruit parings, papers, etc. Upon request of the Women's Civic League, a large number of these cans were put out, and found to be the means of keeping the streets free from litter.

HOW THE HOUSEHOLDERS AND THE PUBLIC GENERALLY CAN HELP MAINTAIN CLEAN STREETS.

Conditions on the newly paved streets in Baltimore became so intolerable that members of the Women's Civic League conferred with his Honor, the Mayor, and, as a result of the conference, the following statement was issued :

"To the Public: The dirty and littered condition of many of our footways and streets should receive the careful attention of the citizens and city authorities, in the interest of sanitation and the public health.

"Special attention is called to the deplorable practice of throwing newspapers and litter on the streets and sidewalks.

"At the request of the Women's Civic League, I am making this public request, that the people of the City of Baltimore refrain from throwing newspapers or other similar material in footways and public streets of the City of Baltimore, and to also call their attention to the fact that this is a violation of the ordinances of the city which renders the person so offending liable to punishment.

"If you want a clean city, sweep in front of your own door.

"I, therefore, call upon all owners and occupants of real estate in this city, as well as other citizens and the public generally, to make a determined and concerted effort to keep their premises and footways abutting thereon clean and free from waste paper and other material.

"The various departments of the City Government will co-operate in every way with the efforts of the citizens to this end.

"JAMES H. PRESTON, *Mayor.*"

HANDLING THE DUST PROBLEM TO THE SATISFACTION OF THE PUBLIC.

Owing to the vast municipal improvements going on in the city, during the past year, His Honor, the Mayor, had a sum of money set apart by the Sewerage Commission, Paving Commission and the Water Department to defray the expenses of this Department in operating three new sprinklers, purchased by the above mentioned departments for the special purpose of keeping down the dust occasioned by this public work. The machines have all been operated by our regular sprinkling gangs, over the streets where work was being done by the above mentioned departments. By this means, the dust nuisance was reduced to a minimum.

MORE SQUEEGEE MACHINES BOUGHT AND MORE WILL BE NEEDED WITH THE CITY'S GROWTH.

The Department purchased three additional Squeegee Washing Machines, during the year, for use on the improved pavements. These improved pavements are also cleaned by the block system; that is to say, a sweeper with broom and handcart cleans a certain number of blocks; the number of blocks cleaned by any one man varying according to location and the amount of traffic.

The Department now owns thirteen of these Squeegee Machines, twelve of which are kept in constant use; one being held in reserve in case of break-down.

Improved pavements are washed four or five times a week. the number of times also varying according to location and traffic conditions. This seems to be the only method in use all over the country for the successful ridding of the streets of dust, thereby keeping them in sanitary shape.

While on a visit to Winnipeg in August, as a delegate to the convention of the League of American Municipalities, I stopped at Detroit, Cleveland, Chicago, Pittsburgh and New York, and observed the machinery in use by the street cleaning departments of these cities. I can truly say, without fear of contradiction, that Baltimore has just as up-to-date machinery as any of the big cities of the country.

NO SPECIAL CLEAN-UP CRUSADE NEEDED.

In the early Spring, members of the Women's Civic League conferred with me in regard to having a regular clean-up of the city. After showing them reports of the number of loads of ashes and of the rubbish that had been hauled during the winter months, it was deemed unnecessary to inaugurate a crusade of this kind. This favorable condition was due to the mild winter last season, the street carts being regularly employed in their work. The season also enabled the street carts, at times, to render special assistance to the carts of the Sanitary Division.

SEPARATION OF GARBAGE AND ASHES.

The ordinance requiring householders to keep ashes and refuse separated from garbage is a source of constant annoyance to the Department. The officers, however, are vigilant in their duties, thereby preventing, to a large degree, any vegetable matter from being deposited on the ash dumps.

THE COMPLETION OF 32 MILES OF NEW PAVEMENTS MEANS MORE WORK FOR THE DEPARTMENT.

During the year just closing, 32 miles of improved streets were turned over to the Department by the Paving Commission and 6 miles of macadam streets by the Commissioners for Opening Streets. These streets are washed by the washing machines. In addition to cleaning by the machines, a certain number of blocks are laid off to a man, with handcart and broom, who keeps the streets in each block in sanitary condition.

BLOCKING OF STREETS AND ALLEYS, DUE TO PUBLIC IMPROVEMENTS, HAMPERS GARBAGE COLLECTING.

Owing to the fact that blocks of streets as well as alleys have been closed for weeks at a time, the Department has had serious trouble in making the household collections of garbage and ashes. This blocking of streets has been due to the work of the sewerage contractors, and the contractors laying improved pavements under the Paving Commission. A number of complaints were received from the householders due to these causes. In every instance, however, after a visit from one of the Department Inspectors, the trouble has been adjusted to the satisfaction of the complainant.

RETURN OF SILVER.

During the year, the Department returned to the owners, after identification, 925 pieces of silverware. This silver was found mixed with garbage which was being deposited on scows of the Southern Product Company.

GARBAGE REDUCTION PLANT.

The annual inspection of the Garbage Reduction Plant at Bodkin Creek took place on Thursday, June 26. After a careful inspection, the plant was found to be in first-class condition, the contractors carrying out the specifications to the letter.

MEDALS FOR EFFICIENCY AWARDED AT THE ANNUAL INSPECTION AND PARADE.

The annual inspection and parade of the Department took place on Monday, May 12, at 2 P. M. The parade formed on Broadway, south of Baltimore street, and on Gough street, east of Broadway.

Twelve members of the Department were presented with "service medals" by his Honor, Mayor James H. Preston. After a splendid address, the medals were pinned on each man's coat by the President of the Second Branch City Council, Mr. John Hubert. The ceremonies were conducted in the presence of a large number of ladies from the Women's Civic League.

After the presentation, the members of the Department in new uniforms, and the cartmen, with newly painted vehicles, paraded through the business section as well a good portion of the residential section of the city. The parade was led by a fine band. The display was interesting to the general public, judging from the large number of people who witnessed the same.

"Service medals" were awarded to employees because of individual efficiency and diligence in their work.

The parade was marshaled by Supt. John T. O'Connor.

REPLACING WORN-OUT STOCK WITH NEW.

Forty head of stock was disposed of during the year, some having died, others sold as being unfit for our work. Fifty-three heavy draft horses were purchased to meet the requirements of our work. The general up-keep of the Department is in better condition than it has been for years. All vehicles of every description were thoroughly overhauled, painted and put in first-class condition for the annual inspection and parade, which took place in May. This work was all done at our main shop, Pratt street and Central avenue.

ADDITIONAL FACILITIES FOR THE COMFORT OF STOCK AND FOR EFFECTIVE WORK.

During the year the Inspector of Buildings erected forty additional stalls for horses on the mezzanine floor of Station "A," Pratt street and Central avenue. This was made necessary for the care of additional stock purchased for the operation of Department work. Alterations were also made by the Building Inspector at Fulton Avenue Stable to accommodate the dumping of garbage carts into auto truck.

The City Engineer's Department paved the floor of the wagon and cart shed at Station "E" with Belgian blocks, tarring the joints, etc., thereby doing away with an unsanitary yard at this location, making it one of the most up-to-date stables in the city.

HANDLING THE APPROPRIATION SO AS TO PRODUCE A SURPLUS.

The total appropriation for the year was $822,658.22. Total expenditures were $762,154.64. Money received from the sale of street dirt, sale of disabled horses, miscellaneous refuse, and special work done, amounted to $6,398.97, the largest amount ever received by the Department from such sources. The total amount returned by the Department from all sources amounted to $71,902.55. The work for the year was accomplished with the same appropriation the Department received for work during the year 1912.

DEATH OF EMPLOYEES.

The year was marked by the death of one superintendent and two foremen, all very efficient men, having been in the Department six and twelve years respectively. Their places were filled by promotion from the ranks.

In presenting my report for the year ending December 31, 1913, I also submit the appended tables, showing the number of employees, the work done, and the cost of the same in each branch of the service.

Respectfully,

WM. A. LARKINS,
Commissioner of Street Cleaning.

Hours: On week-days, 9 A. M. to 3 P. M.; on Saturdays, to 1 P. M.

REPORT

Baltimore, December 31, 1913.

To the Honorable Mayor and City Council:

Gentlemen—To the Supervisors of City Charities is entrusted the care of certain classes of the dependents of Baltimore city for which private charity fails to provide. The following dependents come under the charge of the Supervisors by the terms of the City Charter:

Indigent aged and infirm.
Indigent sick.
Indigent insane.
Dependent children.
Temporary care of homeless men.
Transportation of non-resident poor to their homes.
Dependent blind.
Temporary care of wayward women.

To care for these dependents the Supervisors not only directly maintain and conduct institutions at Bay View and medical agencies or dispensaries in various parts of the city, but also contract on a per capita basis with various State and private institutions for the care of the sick, of the insane, of homeless men and of dependent children. In addition to the institutional care provided for certain dependent children, the Supervisors place large numbers of such children in free private homes, where they are carefully supervised and watched by trained visitors.

Bay View.

The improvements at Bay View have been actively continued during the year 1913.

Service Building.

The new kitchen and dining-room building, known as the Service Building, has been completed, and was brought into service in June. This building has in every respect fulfilled the purposes for which it was constructed, and was moreover built within the appropriation of $75,000, which was made for it in the year 1912. It serves a two-fold purpose. In the first place it has provided for the institution a thoroughly modern service building, with a first-class kitchen, bakery, ice and refrigerating plant equipped with the most complete and efficient labor-saving machinery, and with attractive and ample dining-room facilities as well. This Service Building not only meets the present requirements of the institution, but will be sufficient to take care of the needs of the institution for many years to come. The opening of this building has benefited the institution in another way. The various rooms in the old main building which were previously used as dining rooms are now available for dormitory purposes, and the opening of the new building has thus done much to relieve the overcrowding in the main building, which has been so justly criticised in the past.

Cow Barn.

The new cow barn, for the construction of which $12,500 was appropriated in the year 1913, has been practically completed and is a credit to the city. The building has been located about 400 yards to the northwest of the power-house, in a spot where it is protected from the winter winds. The cow barn proper will house fifty cows. It was planned by the architects, Messrs. Parker, Thomas and Rice, with the co-operation of the experts of the Dairy Division of the United States Department of Agriculture, and of the Maryland Agricultural College, and represents the latest and most approved ideas of sanitary construction. The feed barn adjoining has been built sufficiently large to meet the needs of an additional cow barn unit doubling the accommodation for cows, which the institution will probably require in a few years. The new barn will probably not be occupied until the spring, as the grading about the building has not yet been completed. A cinder road has been constructed to the barn.

Bungalow.

The bungalow for the physicians of the Tuberculosis Hospital has been completed, and will be occupied by January 1. This is a one-story building situated about 200 feet to the west of the Tuberculosis Hospital. The physicans in charge of the Tuberculosis Hospital have hitherto been housed about a quarter of a mile distant from the Hospital in the overcrowded Administration Building. Their location in this new building will not only add greatly to their comfort, but will add to the efficiency of the medical service. The cost of the bungalow proved to be about $5,000, or some $1,500 greater than the $3,500 appropriated. This difference was allowed by the Board of Estimates from the Contingent Fund, but as there was a balance left over from the appropriation for the cow barn, which was built for less than the appropriation allowed, the aggregate cost of these two new improvements has not exceeded the total amount appropriated.

Improvements to Main Building

In the appropriations for 1913, $29,000 was allowed for improvements to the main building, or old almshouse. The necessity for a complete renovation of this building has been called attention to in previous reports. Some of the more pressing needs are the installation of a ventilating system; new plumbing involving the construction of two new brick annexes; new flooring throughout, and also new fire-proof stairways, and the installation of a sprinkler system and high pressure standpipes for better fire protection of the building. The total cost of these improvements will probably exceed $150,000, and are a vital part of the plans for the improvement of Bay View included in the carefully drawn up scheme which has been worked out for the improvement and development of the institution. The appropriation for 1913, just referred to, has enabled the Supervisors to make a start in repairing and improving the main building. A complete sprinkler system is being installed in the halls and corridors throughout the entire building, as well as throughout the basement and roof space. Fire doors have also been installed, which will permit the division of each floor into five separate sections. The standpipe high pressure fire service in this building, as well as in some of the other buildings at Bay View, has been increased in capacity. Several additional fire plugs with direct connections with the reservoir have been placed immediately in front of the main building, which will permit the steamers of the city Fire Department to operate in the most effective way in the case of fire in this building. These measures for the better fire protection of the institution have been carried through by the advice of Mr. Charles L. Reeder, consulting engineer of the Supervisors, with the co-operation of the Board of Fire Commissioners. It is hoped that the new system will be in complete operation within a short time, as the need of better fire protection at the institution is felt to be an urgent one.

For the year 1914, $50,000 has been appropriated by the Board of Estimates for improvements at Bay View. The greater part of this appropriation will be spent in improvements upon the main building The report of the Supervisors for 1912 shows in detail the improvements planned, to which brief reference has just been made. It seems wise to take up the improvements to the main building in two sections. The condition of the east, or men's wing, is rather worse than that of the women's wing, so that the work will be begun there.

Ventilating System—It is proposed to install a ventilating system in the east wing as soon as possible. The stack of the old power-house, which was formerly located immediately in the rear of the main building, acted as a ventilating shaft for the entire building. Since the power-house was abandoned about two years ago, and the stack torn down to make room for the new Service Building, the old building has had no ventilating system, and conditions in respect to ventilation during the winter months have become almost unbearable. The old system of ventilating ducts are insufficient, and an entire new system will have to be installed. Work will be begun on this early in the coming year.

Plumbing—The plumbing in the main building requires complete reconstruction. The present plumbing is not only absolutely unsanitary, but is also entirely inadequate for the requirements of the 1,200 people housed in this building. The bathrooms and toilets are now located in two shallow brick annexes in the rear of the sun porches, in the wings of the main building. It will be necessary to enlarge these two annexes to make sufficient room for the bath tubs, showers, wash basins and toilets required. It is proposed to remodel and equip with modern plumbing the east wing during the coming year. In addition to the equipment required on each floor, to meet the needs of the inmates, there will be constructed on the ground floor bathrooms where new inmates can be taken for their bath on first entering the institution. At the present time all the inmates of the infirmary or almshouse on the men's side, and all new inmates, are bathed in a small bathhouse situated several hundred feet from the main building, which is not only undesirable in the winter from the standpoint of health, but also greatly increases the work of the attendants. This antiquated system can now be done away with.

Floorings—Sample floorings of different makes of composition flooring will be laid in one of the corridors of the east wing of the main building, where they will be subjected to equal and severe wear. It is hoped that from the floor materials to be thus tested, that a flooring best suited for the entire building can be selected.

Other Bay View Improvements.

Coal Conveyer and Lavatories—Appropriations have been secured for erecting a shed over the coal conveyer at the new power-house, and also for building lavatories in the yards used for recreation purposes in the rear of the main building.

Furnishings and Automobile Ambulance—Appropriations have also been made for furnishing the new Service Building and the new bungalow, and allowance has also been made for the purchase of an automobile ambulance for conveying patients to the institution. The latter will greatly increase the efficiency of the medical work, and will save an enormous amount of time.

Bay View Grounds—The condition of the Bay View grounds has been far from satisfactory. The construction by open cuts of a system of tunnels from the power-house to the several buildings of the institution, the installation of the new sewerage system connecting the various buildings with the outfall sewer, the installation of the new high pressure fire lines, and the erection of several new buildings, have resulted in widespread defacement of the grounds and lawns. During the past year, much has been done to improve conditions, but a great deal still remains to be done. An appropriation of three thousand dollars for the improvement of the inmates' recreation grounds in the rear of the main building will help greatly to improve the appearance of the whole place. It is proposed to regrade these recreation grounds, to eliminate surface drainage, and to construct a system of grass-plots and cement walks with benches for the use of inmates.

The present boardwalk, from the front gate to the main building, is in such condition as to make its use dangerous. It is planned to replace this with a concrete walk, and also to build concrete walks connecting the various other institutional buildings with the main building.

In recent years, the number of cases committed to Bay View for misdemeanors has shown a great reduction, as the present law forbids the commitment of any able-bodied individual to Bay View. The necessity for bolts, bars and high fences is therefore no longer felt. It is proposed to tear down the numerous unsightly and dilapidated fences which surround the buildings, except those around the buildings used for the care of the insane, and to replace the fences with hedges. This should add greatly to the appearance of the whole place.

The gradual removal of the farm buildings from their present location, between the main building and the general hospital, to that portion of the grounds where the new cow barn is situated, is contemplated.

The reorganization of the medical and nursing staff which was inaugurated a few years ago has proven highly successful. The change in the character of the infirmary or almshouse population, owing to the exclusion of all able-bodied individuals from the institution, has resulted in an increasing difficulty in having the orderly work of the institution done by inmates, as was formerly the case. This makes necessary the employment of additional labor, and naturally adds to the cost of maintaining the institution. Provision has been made in the appropriations for 1914 for several new positions, which it has been found necessary to create to properly conduct the institution. Several salary increases which were asked for were not allowed. This will not only make it difficult for us to retain the services of several good officers, but will also make it difficult to secure capable persons to fill vacancies in these positions.

The expense of conducting Bay View has increased rapidly during the year. This has been largely due to the increase in the cost of foodstuffs. Many articles of food consumed in large quantities, especially meats, show an increase of from 25 per cent. to 40 per cent. over the preceding year.

The Insane.

Attention was called in the last annual report to the fact that the loans authorized by the Legislature in 1910 and 1912 were not sufficient to provide State care for all the indigent insane in Maryland, and that relief from the overcrowding at Bay View was not in sight. The State Lunacy Commission, in their efforts to remove all the insane from the various county and local almshouses to State institutions, have overlooked conditions at Bay View. In order to provide State care for the indigent insane of the State at Bay View and elsewhere, it will be necessary for the Legislature to appropriate at least $600,000 for new buildings. No question of more urgent importance will come before the Legislature at its coming session than this. The buildings at Bay View for the care of the insane are totally unsuited to modern methods of treatment, and one of the buildings is in such bad condition that its use should be discontinued as soon as possible. Apart from humanitarian considerations, it is obviously unfair that provision should be made by the State for the care of the indigent insane of the counties in modern State hospitals with funds largely provided by the tax-payers of Baltimore, while about 400 insane from Baltimore are maintained at Bay View entirely at the expense of the city.

Institutions.

For the care and treatment of the various city charges outside of Bay View, contracts on a per capita basis have been entered into with thirty-six institutions. Under the City Charter lump appropriations to the institutions dealing with dependent children, the insane, with the sick in hospitals or dispensaries, with homeless men, with unfortunate women, with the care of the dependent blind, are forbidden, and such institutions as the city contracts with for the care of these classes must be paid on a per capita basis only for work actually done. The Supervisors have exercised a rigid supervision over these institutions, and have determined that each case cared for was deserving of city aid.

Child-Placing.

Provision has been made for the care of dependent children who have become city charges, by either placing them in free private homes or in institutions. In general, it may be said that the children who have become city charges have been committed to the care of the Supervisors by the courts or otherwise because private charity has failed to make provision for them. In deciding whether a child shall be placed in an institution or in a free private home, the individual needs of each child are carefully considered, but whether placed in private homes or in institutions, all such children remain in charge of and under the authority of this Department, and frequent visits by trained agents are made to the private homes and to the institutions to make sure that proper care and attention are being bestowed.

The Supervisors believe that where the home has been broken up, the normal child is being given the best chance in life if brought up in a good private home. This policy has resulted not only in giving the child a greater advantage in its future struggle in the world, but has resulted in the saving to the tax-payers of a large amount which was formerly spent in the maintenance of children in institutions. Whether placed in a free private home or institution, the religious antecedents of the child are always considered.

In 1913 the Supervisors were requested to assume charge of 234 children. By careful investigation of these cases, however, the number which were actually accepted as city charges was reduced to 81; private charity providing for 95 without cost to the city, while relatives having suitable homes were induced to take charge of 58 children, and in this way many families were held together which would otherwise have been disrupted. In addition to this number, 36 children in institutions were returned to their relatives, and the families reunited. Suitable free private homes, other than those with relatives, were found for 80 children. Including those children who have come under our control in previous years, there is now a total of 560 children who are wards of the city and under the care of the Supervisors. Of this number, 284 are in good private homes, without cost to the city, except the comparatively trivial expense which visiting and supervision by the trained agents of the Department entail. Two thousand one hundred and twenty-one visits were made by these agents in the interest of these 560 children.

In addition to the institutions contracted with last year, a contract has been made this year with St. Katharine's Home for the care of eight colored girls.

In the year 1913, in addition to the hospitals and dispensaries previously contracted with, a contract was entered into with the Franklin Square Hospital for ten beds, to meet the increasing need for hospital accommodations in the southwestern part of the city. It was also found advisable to add the Locust Point Dispensary to the dispensaries contracted with by the city, to meet the urgent needs of the Locust Point territory.

The Supervisors have continued to contract with the Friendly Inn for the care of homeless men.

Under the Charter the Supervisors are entrusted with the expenditure of a fund of $1,000 to provide transportation for certain non-resident poor and destitute to their homes, when these are situated outside the City of Baltimore; $510.73 was spent during the year for this purpose.

During the year 1913, as in previous years, the Supervisors have recommended to the Mayor twelve families among the deserving poor which, under the terms of the will of the late Orville Horwitz, are to enjoy the interest from a fund of twenty thousand dollars left by him for this purpose.

Few changes of importance have been made during the year in the management of our city offices located in the Court House and in the City Hall Annex. The cost of maintaining these offices was $10.317.89 during the past year. This sum has been largely expended for the salaries and traveling expenses of clerks and trained agents, whose duty it is to make a thorough investigation of the status of all persons applying for aid, to visit and inspect the numerous private institutions with which the Supervisors contract, and to watch over the welfare of children placed in free private homes scattered throughout the State. The entire cost of operating our city offices was more than returned to the city treasury in the one item of money collected through this office from the "reimbursing insane." The amount received from this source and turned over to the Comptroller in 1913 will be $18,209.91, an increase of $2,227.95 as compared with 1912.

The Supervisors expended during the year 1913, $535,161.34, as compared with $542,542.27 in 1912. Detailed reports of the work at Bay View Asylum and the other activities of the Department accompany this report. The following table shows the amounts appropriated by the Mayor and City Council for the use of this Board.

1913.	Appropriation.	Expended.	Unexpended.
Bay View, salaries	$67,118 00	$61,480 73	$5,637 27
Bay View, expenses	155,589 00	155,589 00	....
Bay View, Improvements—			
Main building	29,000 00	29,000 00	....
Cow barn	12,500 00	12,500 00	....
T. B. bungalow	3,500 00	3,500 00	....
City office, salaries	8,860 00	8,720 00	140 00
City office, expenses	1,600 00	1,597 89	2 11
Hospitals	75,379 00	69,672 46	5,706 54
Insane	171,500 00	159,837 03	11,662 97
Temporary care of homeless men.	2,000 00	1,990 00	10 00
Transportation	1,000 00	510 73	489 27
Dispensary	10,500 00	10,250 13	249 87
Children	25,000 00	20,513 37	4,486 63
Totals	$563,546 00	$535,161 34	$28,384 66

Amount expended			$535,161 34
Amounts paid to city:			
Bay View, sale of old material	$156 13		
Bay View, board of inmates	541 90		
		$698 03	
Reimbursing through city offices:			
For care of insane	$18,209 91		
For care of children	135 00		
		18,344 91	
			19,042 94
Net cost of all departments			$516,118 40

REPORT OF BAY VIEW ASYLUM

BAY VIEW ASYLUM, January 30, 1914.

To the Supervisors of City Charities:

GENTLEMEN: I have the pleasure of handing you herewith the annual report of Bay View for the fiscal year ending December 31, 1913:

POPULATION.

The total number of inmates in the institution, including all departments, on the morning of January 1, 1913, was 1,551 (761 white males, 303 white females, 237 colored males, and 250 colored females). The total admissions during the year was 2,158, and eight were born in the institution, making a total of 2,166 (white males, 1,262; white females, 329; colored males, 377; colored females, 198). Of these admissions, 248 were readmissions and 197 were persons who were in the institution at the beginning of the year and who were discharged and readmitted during the year. The actual number of individual persons cared for was 3,124.

The number remaining at the close of the day, December 31, 1913, was 1,585 (779 white males, 315 white females, 244 colored males, and 247 colored females), an increase of 34 as compared with the same day in 1912.

The daily average number of inmates during the year was 1,478 as compared with 1,488 for the year 1912, a decrease of 10.

The highest number present at one time was 1,641 on February 16, and the lowest, 1,354 on October 7.

The total number remaining in each department at the close of the day, December 31, 1913, as compared with the same time in 1912, was as follows:

	1913.	*1912.*	*Increase.*	*Decrease.*
Insane	399	341	58	....
Tuberculosis Hospital	143	157	....	14
General Hospital—				
Ward "A"	128	128	....	....
Male chronic	18	16	2	....
Female chronic	18	16	2	....
Infirmary	870	893	....	14
	1,585	1,551	62	28
	1,551	.....	28	....
Net increase	34	.....	34	....

DEATHS.

The total deaths for the year was 628 (257 white males, 107 white females, 155 colored males, 109 colored females), an increase of 41 as compared with the year 1912. The deaths from tuberculosis were 289, or 46 per cent. of the total deaths. Two hundred and sixty-three, or .418 per cent. of the total deaths were colored, an increase of 27, as compared with 1912.

The average age of the white males who died was 52½ years.

The average age of the white females who died was 52⅓ years.

The average age of the colored males who died was 44½ years.

The average age of the colored females who died was 49 7-12 years.

The average age of those who died of tuberculosis was 40¾ years.

The average age of those who died, exclusive of the tuberculosis cases, was 57⅚ years.

The average age of the total who died was 50 years.

Four hundred and thirty-seven bodies were claimed by friends, 71 by St. Vincent de Paul's Society, and 120 unclaimed were turned over to the Anatomical Board.

COMMITMENTS BY POLICE MAGISTRATES.

The total commitments by the police magistrates during the year was 215 (134 white males, 27 white females, 47 colored males, 7 colored females), a decrease of 49 as compared with the year 1912.

Some of these commitments were persons arrested for being drunk. In one case, a man with an income of $500 per annum ($360 of this amount a soldier's pension), was committed for a period of three months. He was 76 years old, but fairly able-bodied. He was discharged on writ of habeas corpus. As Bay View is neither a penal institution nor a reformatory, it is better for the reputation of the place that as few commitments be made as possible. All persons should be examined by a physician before commitment, and if found to be a case for our care, an admit can be obtained from our admit clerk, or if the admit cannot be obtained, the commitment should be made for one or two weeks, so that the party committed can be discharged as soon as able to go out.

FINANCIAL.

The amount appropriated for the support and improvement of Bay View by the Board of Estimates for the year 1913 was as follows:

For salaries	$67,118 00
For expenses	155,589 00
For new improvements	45,000 00
Special from Contingent Fund for completion of bungalow,	1,624 70
Unexpended balances brought forward from 1912	61,064 82
Total available	$330,396 52

Out of this amount was expended:

For salaries	$61,273 23	
For expenses	155,589 00	
For new improvements	84,542 05	
Unexpended salaries remaining in city treasury	5,844 77	
Unexpended improvement appropriation carried forward to 1914	23,147 47	
		330,396 52

Five hundred and forty-one dollars and ninety cents for board of inmates in hospital and infirmary, and $156.13 for sales of old material, was collected and paid to the City Comptroller; $1,110.56 for board of insane was collected by the Secretary of your Board and paid to the City Comptroller. These amounts have been deducted from our expenditures in arriving at the net cost of maintenance.

The per capita cost of maintenance in each department was $147.53 for insane, $222.53 for Tuberculosis Hospital, $228.02 for General Hospital, and $102.78 for Infirmary. The average of the total of all departments was $146.93.

The per capita cost of feeding in each department was $44.32 for insane, $88.90 for Tuberculosis Hospital, $74.28 for General Hospital, $37.01 for Infirmary, and the average for the whole population was $49.80, or 13 7-10 cents per day for each person.

The cost of provisions considerably increased during the year; at one time the cost of beef and bacon was 40 per cent. more than in 1912

MEDICAL BOARD.

The regular meetings of the Medical Board have been held monthly, and special meetings when the interests of the institution required them. The attendance throughout the year was good.

City Detention Hospital for the Insane.

Dr. Ralph P. Truitt, who was the physician-in-chief at the beginning of the year, resigned on May 1, and was succeeded by Dr. Kenneth B. Jones on June 1. He has as assistants, one resident physician and one interne.

The total number of inmates in this department at the close of the day, December 31, 1913, was 399, as compared with 341 the same date in 1912; an increase of 58.

The daily average number of inmates for the year was 384, a decrease of 11 as compared with the year 1912.

The admissions during the year amounted to 360. The deaths were 88 and discharges 214; 94 of the latter were transferred to State hospitals and Mount Hope.

The highest number present on any one day was 415, on August 12, and the lowest 341, January 1 and 3.

The white and colored wards are both overcrowded.

Through the efforts of the President of the Board, a special appropriation was obtained from the Board of Estimates, which was used for the purchase of additional furniture, etc., and the wards are now in better condition than they have ever been.

Those of the patients able to work have been given employment of some kind. The women's sewing-room turned out 4,600 pieces of various kinds of clothing, etc. An appropriation has been secured this year for a sewing teacher, and it is hoped better results will be obtained. Moving-picture shows were given through the winter months and music in the yards every two weeks during the summer.

The laymen of the Episcopal Church hold service two Sunday mornings a month.

Tuberculosis Hospital.

This department, under the charge of Dr. Gordon Wilson with one resident physician and four internes (an increase of two during the year), has kept up its good work.

The total number of patients at the close of the day, December 31, 1913, was 143, a decrease of 14 as compared with the same day in 1912. This decrease is due to the opening of new wards at the State Hospital at Sabillasville, Md., for the more advanced cases.

The daily average number of patients for the year was 152, a decrease of five as compared with the year 1912.

We have to thank the Sunshine Society for their generous gift of steamer chairs and blankets, which have added much to the comfort of the patients. The St. Vincent de Paul Society has also been very kind in distributing fruits, candy, tobacco, etc., every Sunday.

A bungalow for the doctors has been built and is now occupied. It is situated nearer the hospital than their old quarters, and is much more convenient for them.

GENERAL HOSPITAL.

This department remains under the direct charge of Dr. Thomas R. Boggs, physician-in-chief, and Dr. Arthur M. Shipley, surgeon-in-chief, with a resident staff of one physician, one surgeon and eight internes.

The number of patients remaining at the close of the day December 31, 1913, was 218, three more than the same day in 1912.

The daily average for the year was 224, an increase of four over 1912.

The nursing staff has been fairly well maintained, but owing to the appropriation for the pay of orderlies being less than we can get them for, we have to depend entirely on inmate labor for this kind of work, which is very inefficient.

The male and female chronic wards are overcrowded, and additional accommodations must be provided for these cases at an early day.

INFIRMARY.

The total number of inmates in the Infirmary (exclusive of those requiring hospital treatment and who are included in the hospital average) at the close of the day, December 31, 1913, was 825 as compared with 838 the same day in 1912; a decrease of 13.

The daily average number of inmates for the year was 718, three more than in 1912.

The new service building, erected in rear of the Infirmary, was opened August 1. The dining-rooms in this building are a great improvement over the old ones, which are now converted into dormitories, and relieves the congestion we have had for several years.

FARM.

The Board of Estimates, in making up our budget for 1913, cut out two farm hands we had been employing for several years. When it is considered that these hands have been used for other work besides farming, such as keeping up the roads, hauling ashes, grading and keeping the grounds in condition, it will be understood the serious inconvenience and loss it has been to the institution, and rendered it impossible to keep the grounds in the condition they should be. Notwithstanding the loss of this help, the produce raised, including milk at a fair valuation, shows an estimated profit of $2,340.65. These profits would have been considerably increased had it not been that cholera broke out among our hogs and prevented our killing the number we expected

One thousand eight hundred and seventy-eight gallon-cans of tomatoes were put up by our own labor for winter use.

A modern cow barn has been erected, but will not be occupied until the coming spring.

IMPROVEMENTS.

The new service building which was in course of erection at the beginning of the year has been completed. It contains dining-rooms for the Infirmary inmates, a modern kitchen, bakery, ice-plant, cold storage and general storeroom. The kitchen and bakery have all the modern conveniences for work in each department, and in equipment is superior to any institution in the State.

A modern cow barn has been erected with stabling accommodations for 50 cows.

The main building has been equipped with a sprinkling system, fire doors put in the hallways and additional stand-pipes put in all the buildings, with exception of Ward A.

A number of minor improvements have been made by our own labor, such as underground drainage for down-spouts on new service building, grounds in rear of main building, down-spouts on bungalow and nurses' home, laying water mains to cow barn, cement pavement in rear of service building, etc.

GENERAL.

Church services are held at regular intervals by different denominations and laymen who have been so faithful for many years.

A number of entertainments have been given by kind friends and a frequent distribution of fruits, candy, etc., made to the inmates by persons who have devoted their time in looking after the welfare and happiness of the poor unfortunates under our care.

With thanks to the Board for their confidence and many courtesies extended me,

Respectfully submitted,

LAMAR HOLLYDAY,
Superintendent.

BAY VIEW HOSPITAL

BAY VIEW HOSPITAL, December 31, 1913.

To the Supervisors of City Charities:

GENTLEMEN: In accordance with the precedent of former years, we beg to submit our report of the work in the General Hospital for the year 1913, with comments on the progress and the needs of the institution at Bay View as we can see them.

GENERAL HOSPITAL.

The work in the General Hospital has been conducted with enthusiasm and success, as far as the activities of the medical and nursing staff are concerned.

The building, as has been mentioned in our previous reports, is a frequent source of trouble and at times of severe distress to us. The prime defect is in the heating apparatus, which is absolutely inefficient for anything but very mild weather. In the average winter, and without any extraordinary wind, the temperature of our west wards will be about 50 to 55 degrees as a maximum. Though this past two months has been mild we have already had freezing temperature in the wards, on one day as low as 28 degrees Fahrenheit. This is absolutely wrong and jeopardizes the life of our sick people. Contributing largely to this trouble is the very unsatisfactory character of the windows and ventilators, which are poorly constructed and leaky. We earnestly ask your attention to this trouble; it is one which would lead to serious criticism if it were generally known.

Again, we beg to call your attention to the necessity of some relief from the plague of flies. There is every demonstration that the epidemic of typhoid during the fall just past was due to fly-borne infection. The epidemic entailed a morbidity of 22 cases, with a death list of eight, and six left now in the hospital. That the disease did not reach a more serious degree was due to the prompt vaccination of the insane wards and almshouse districts involved. In this connection we should like to express our appreciation of the co-operation of the Health Department in furnishing the vaccine, and of the administrative officers in enforcing the obedience to orders. In our opinion, unless the breeding places of the flies are chemically treated or screened, or both, we can look for little relief from this great danger to the health of our personnel and patients.

We have heretofore requested that the sitting-room in the hospital be furnished with the necessary lights and shelves for the comfort of the officers and the easy access to the Reference Library.

A number of donations to the Medical Library have been made by physicians in the city.

The electric installation in the walls of our building is still imperfect, and does not permit of the safe use of electric hand apparatus. It would be a great saving in time and labor to the doctors and nurses if this could be corrected.

The need of an adequate X-ray outfit becomes more and more pressing each year. The only use we can make of this important diagnostic aid at present is such as we ge through the courtesy of the Johns Hopkins Hospital.

The provision that a small contingent fund to replace the broken and purchase some new instruments for the operating room and laboratory is earnestly requested. If we could have $200 for this purpose it would facilitate our work greatly.

We should also like to call the attention of the Board to our previous communication (in 1912) touching the purchase of a certain number of new beds and mattresses to replace the old—this is very urgent; and the use of a better grade of rubber sheeting to save the loss in mattresses.

Since our last report, the handling of the tuberculosis problem has been greatly improved, and we now have relatively little loading of our wards with infectious cases of this kind.

The labor question has been improved somewhat by the increase allowed us last summer, but it still looms up as the big problem in the running of the hospital. The city must be taught to face the certainty that we cannot run a modern institution with derelict almshouse labor.

The laundry continues to be overburdened and inefficient. There is no adequate accounting system for the linen and there is consequent confusion and loss, as well as great shortage of clean supplies.

CHRONIC HOSPITAL.

The situation in the chronic hospital has become very acute and urgently needs the attention of the Supervisors. The number of more or less helpless patients who need some nursing and cleaning is on the increase, our chronic wards are full, and the general hospital is handicapped with a number of these persons who take up room and time and who are not really candidates for medical treatment We earnestly recommend that the provision for these cases be increased, and that as early as possible.

DISPENSARY.

The detailed report on this subject has long been in your hands and has been favorably considered by the Board, but all action has stopped at this point. Let us remind you that in this past year 11,000 cases have been treated in the medical dispensary, and 4,600 cases in the surgical dispensary, and we are sure that if your Board could see the place in which this work is required to be done they would agree with us that it is wholly inadequate and entails an unreasonable burden upon the medical and nursing staff.

May we again call your attention to the extremely inadequate telephone service, both internal and external. There is but one wire to serve the needs of the almshouse and three hospitals, with a total population in the neighborhood of 1,500. We should have a switchboard and a competent operator.

We would especially like to commend the satisfactory administration of the pharmacy. It has been a year entirely free from the difficulties and errors that were so common up to appointment of the present incumbent. We urge, on her behalf, that the proposed improvement of the drug room be undertaken as soon as possible, and especially that she be supplied with the services of a scrub woman for one half day three times a week.

The resident staff have been most satisfactory and enthusiastic in their work. In the three years we have been working on the new basis, there has never been any disturbance or scandal or bad behavior on the part of our staff; in fact the tone of the men is comparable in every respect to the best in the country. In this connection we should like to call your attention to the unsatisfactory state of the officers' dining-room. A most disagreeable sink is still maintained in the room, and cooking and service of the food is very poor. This is true also of the nurses' dining-room. We are convinced that if the good quality of food which is purchased for these tables were properly cooked and served, we should have no complaint whatever from our staff, but unless someone takes an active interest in this feature, good food is wasted and good people made unhappy.

ALMSHOUSE AND PREMISES.

It is unnecessary for us to repeat the recommendations we made last year, as they are still applicable to the present situation. We should like to mention, however, the need for sterile water and paper drinking cups in the almshouse, and the great necessity of removal of the open privies in the yards.

Department of Pathology.

The growth of this department under the new arrangement has been the most pleasing and satisfactory feature of the year's work. The staff is enthusiastic about the work and the improvement in their training, and that of the students attending the demonstrations can hardly be overestimated.

Commitment of Unfit Persons.

The Superintendent will doubtless call your attention to the practice of the city magistrates in committing able-bodied vagrants and drunken persons. This is a great hardship to us from the standpoint of administration and discipline. Our attendants are in no way fit to cope with violent drunken persons, and several of them have been injured in attempting to take care of these people. We are not a penal institution, and the law specifically protects us from this sort of abuse. We should urge that magistrates have a medical examination of persons claiming the almshouse privilege, instead of being sent to the Jail or the reformatory.

Respectfully submitted,

Thomas R. Boggs,
Physician-in-Chief.

Arthur M. Shipley,
Surgeon-in-Chief.

ANNUAL REPORT OF THE PATHOLOGICAL DEPARTMENT OF THE CITY HOSPITAL

BALTIMORE, December 31, 1913.

To the Board of Supervisors of City Charities:

The Pathological Service of the City Hospital was reorganized in January, 1913, as follows:

Internes from the different services were delegated as assistants in pathology and served variable periods of time, according to the number of internes on each service. Each of those from the medical service were pathological assistants for three months, and each of those from the surgical service four months. The autopsies from the tuberculosis clinic were likewise performed by the resident staff, but here the major part of the work was undertaken by the resident-in-chief. The autopsies from the almshouse and the insane department were performed by one of the assistants from the above three services.

The duty of these assistants was to perform the autopsies on the cases dying on their respective services, to write complete protocols of their post-mortem examinations and to prepare microscopic sections of the important lesions of each case from the tissue preserved at the time the autopsy was performed.

The pathologist-in-chief visited the City Hospital two or three times a week. It was his duty to examine the tissues and organs of every autopsy; to demonstarate the lesions, particularly to the pathological assistants; to correct the protocols; write the anatomical diagnoses and the microscopic notes. During one of the visits each week a conference was held with the physician-in-chief and the entire clinical staff; and, at this time, the clinical and pathological findings of the cases were compared. At a second visit each week consultation was held with the surgeon-in-chief and the anatomical material was demonstrated to the students of one of the medical schools of the city, usually the University of Maryland.

The protocols of the autopsies performed at the City Hospital during the past year, after being carefully corrected and supplemented by a brief synopsis of the clinical history, have been typewritten and bound. Tissues of all the important organs and lesions of each case were removed at the time of autopsy and have been preserved in formalin in individual jars—one jar for each autopsy. Sections were taken from these jars for immediate microscopic study. The jars were then carefully labelled and filed. The sections from each case were similarly preserved.

Of the autopsies performed during the year 1913, fifty-six were done in the first six months and ninety-seven the second six months, making a total of one hundred and fifty-three. This number shows a decided increase over the number for the preceding five years, as may be seen from the following table:

	Autopsies.
1908	84
1909	75
1910	88
1911	92
1912	72
1913	153

The total number of deaths occurring in the institution during the year was six hundred and thirty-one; therefore, the percentage of autopsies was twenty-four. It must be remembered, however, that a considerable number of bodies are claimed by the Anatomical Board and in the vast majority of these no autopsy is permitted. During the current year this board received one hundred and twenty-one bodies. They allowed a post-mortem examination on five, or four and one-tenth per cent.; and did not allow such examination on one hundred and sixteen, or ninety-five and nine-tenths per cent. If these one hundred and sixteen cases be subtracted from the total number of six hundred and thirty-one the percentage of autopsies will be increased to twenty-nine per cent.

The one hundred and fifty-three autopsies were divided among the various services as follows:

Service.	No. of Deaths.	No. of Autopsies.	Per Cent. of Autopsies.
Medical—			
Ward A	158	57	36.0
Almshouse	69	32	46.0
Chronic hospital			
Annex			
Total	227	89	39.0
Surgical	55	19	34.0
Phthisical	261	42	16.0
Insane	88	3	3.4

With the increase in the number of autopsies and the establishment of a system which will furnish the hospital with complete gross and histo-pathological records the needs of the Department have grown.

It would be desirable to have a salaried resident pathologist who could assist the internes serving on the pathological staff and who could utilize the splendid material for demonstration to more students from the various medical schools of the city. He could also carefully investigate the more complicated conditions which arise in the post-mortem work, for which more time is necessary that the internes, who are simultaneously carrying on their clinical work, can afford.

Further, it would be very desirable to have a technical assistant, so that the histo-pathological material could be more promptly and thoroughly investigated.

The great interest which the various departments have taken in the establishment of this new development of the Pathological Department has been extremely gratifying.

It is hoped that the progress of the Pathological Department shown in the past year will be continued in 1914.

Respectfully submitted,

M. C. Winternitz,
Pathologist-in-Chief.

CITY DETENTION HOSPITAL FOR THE INSANE

CITY DETENTION HOSPITAL, December 31, 1913.

To the Board of Supervisors of City Charities:

GENTLEMEN—In compliance with a request from your secretary, I respectfully submit the report of the City Detention Hospital for the Insane for the year ending December 31, 1913.

In studying the statistics, it is seen that there was at the beginning of the year a population of three hundred and forty-one, and that during the year there were admitted three hundred and sixty patients, making a total under treatment of seven hundred and one. The large increase of admissions is, of course, striking—there being seventy more admissions than during the year immediately preceding, or an increase of 24 per cent.; our admission list being, I believe, the largest of any institution for insane in the State. There were paroled and discharged during the year a total of one hundred and thirteen patients, as against ninety-three the previous year, or an increase of 21 per cent. Of this number seven were deported and eleven sent to their legal residences outside of the State. During the year, one hundred and thirty-five white patients were transferred to the State hospitals and nine to Mt. Hope. The State Hospital for the Colored Insane has not relieved us of any of our negro population. Of those discharged or transferred during the year, sixty-one were considered recovered, an increase of forty-two over previous year; eighty-eight were considered improved, an increase of eighteen; and ninety-one, an increase of fifty-three, were considered unimproved. There were, during the year, eighty-eight deaths, an increase of twenty-two, or 33 per cent. over previous year. But in 1912, based on admissions, 23 per cent. died; while this year there was 24 per cent. Of those dying during 1913, forty-six, or 52 per cent., were from two causes—senility and general paralysis. Of those dying, twenty-three, or 26 per cent., were in the hospital less than one month; it not being an unusual occurrence for patients to be admitted in a moribund condition. There were remaining in the hospital at the end of the year three hundred and ninety-nine patients, an increase for the year of fifty-eight. Of those remaining, two hundred and forty-four, or 61 per cent., are negroes. This large percentage being due, of course, to the fact that no negroes were transferred to the State hospitals.

During the latter half of the year covered by this report there has been made the first very fruitful effort at improving the interior aspect of the naturally gloomy buildings of the Insane Department at Bay View—the writer having had the good fortune to have had the use of a certain fund to purchase considerable furniture and other material, which has been used almost exclusively for the furnishing of the wards, the physicians' office and nurses' rooms.

Previous to this, there had been little interest shown—outside of the various physicians-in-chief who have been here—in the improvement of the housing conditions in this Department, which for a long time have been notoriously bad. It had generally been the opinion that little could be done and, in consequence, little was attempted. People generally seem forgetful of the fact that this Department receives the largest percentage of recoverable cases of any department at Bay View, and it is certainly the department where improvements in the general appearance will have the most value in the effect such things have on the condition of those admitted.

The hospital now has none of the old unsightly benches which formerly constituted practically the sole furnishings over all the wards. In place of these we now have mostly mission furniture of attractive and substantial variety. There are settees, rocking chairs and straight chairs sufficient for the accommodation of all the patients. Springs, mattresses and feather pillows have been provided for a much larger number of beds. Many rugs have been placed on the halls, in the sitting rooms and dormitories; pictures and attractive clocks are on all the wards; a heavy linoleum covers the entire length of both halls in the men's building and the floors on all the wards are oiled and polished, as well as the rough surfaces will permit. The furniture for the nurses' rooms and the physicians' office is a very great improvement. The painting of the wards in the entire Department also adds greatly to the general appearance.

The medical work here is greatly handicapped. The population is in three buildings, which are widely separated and poorly equipped for their purpose. Our laboratory is most inconveniently situated and poorly equipped. The staff is entirely too small and too poorly paid. With the very large number of admissions here, and the fact that practically all are acute cases—most of them ill physically, as well as mentally—and with a resident population of four hundred, many of whom require constant attention, one can readily understand the amount of work there is to be done. These facts practically preclude the possibility of our working in any particular field, as our time is wholly taken up with routine mental and physical examinations, with but little time for any particular case. It is certainly to be regretted that a large portion of the clinical material here has to be passed over insufficiently investigated. But I feel that this cannot be remedied with the present restrictions under which we labor, especially with reference to the laboratory feature of the work. We simply don't have the time.

During the latter part of August there began a typhoid outbreak in this Department, during which nine patients and three attendants were affected with the disease. Two of the patients died of the disease. At this time the entire population of this Department was innoculated with typhoid vaccine, which procedure effectually prevented further infection. The outbreak was confined entirely to the male building, and it seemed most conclusive that the infection was air or fly borne and that the source was from an unsanitary, unscreened surface privy which was in close proximity to the dining-rooms. Two facts seem evident: First, that the dining-rooms at least should be screened; and, second, that the surface privies should be abolished. The effectiveness of typhoid vaccine as a prophylactic agent also seemed very clearly demonstrated.

In the field of occupation and amusement little improvement is noted. It should be mentioned, though, that nearly all of the better class of white patients are transferred to State hospitals, leaving us with a class composed largely of seniles, paretics and the like, all of whom are almost totally incapable of any employment. Among the men, both white and colored, the percentage of employed (about 60 per cent.) will compare favorably with other institutions. This Department provides coal passers, farm workers and a grading gang for Bay View, and a large part of the common laboring work around the institution is done by its inmates. From the women we provide the largest part of the help for the laundry, do all our own mending and have a sewing-room, where all the clothes for the women and all the underclothes for the men are made. The greatest problem is among the negro women. Here we have one hundred and thirty women of every sort crowded together on two wards, a fact alone which renders discipline impossible. This also is the class where no suitable employment is provided, for which no funds are provided and with little hope of early State care. The whole question of occupation certainly merits some consideration from those in authority.

The following would seem to me to be some of the many things where great improvement is to be looked for and of which this Department seems most in need:

First—The development of some comprehensive scheme for the housing and proper care of the constantly-increasing number of insane coming from Baltimore city, since it seems evident that total State care of Baltimore's insane can hardly be hoped for.

Second—A better paid and a larger medical staff for this Department, so that the institution could attract men of longer experience and better training than probably the majority of us who have been here have had; and, probably more than anything else, a raise in salary would certainly prevent the all too frequent changes that constantly occur on the staff.

Third—Some arrangement whereby an ambulance service, with competent nurses, can be provided for the early and direct transmission of mental cases from the home to hospitals, and thereby obviate the present system of taking the patient first to the police station, where he is locked up and mistreated, because misunderstood, and then at the convenience of the police authorities brought in the police patrol to the hospital. I might mention that this is the procedure in at least eighty per cent. of the patients admitted here. The profound impression made on patients by this procedure is evident when I tell you that a large number of the patients believe firmly, and so state, that they are sent here to be punished and not for the purpose of effecting a possible cure.

Fourth—That these large, unwieldy wards, where all classes, from idiots up, are compelled to intermingle, and where discipline is impossible, be divided into smaller wards, where a feeble attempt at classification may be made. The only possible classification now is white and colored male and female, a problem which is in itself usually not very diffcult. With this there should surely be some effort made at replacing the unsightly toilets and bathrooms in the female building by something passably hygenic and efficient. The construction of a diet kitchen, where suitable food for sick patients may be prepared, as is provided in all the other departments, is also greatly needed.

Fifth—The employment of at least one field worker, whose salary would more than be equalled by the money saved through the frequency with which employment might be found for patients, or home conditions or surroundings may be so regulated as to permit a patient living outside of the institution.

In conclusion, I wish to express my deep debt to all who are actively interested or are even in sympathy with what we are trying to do. I feel greatly indebted to my assistants on the medical staff—Dr. Eichelberger and Dr. Goldsmith. Especially am I grateful to the Superintendent of Nurses, the Male Supervisor and his assistant and to all the nurses and attendants for their uniform courtesy and consideration. The staff of the General Hospital at Bay View has also been of great assistance by willingly taking care of several of our typhoid patients and especially by carrying out the Wasserman reaction on all blood sera and spinal fluids submitted by this Department.

To Dr. Henry J. Berkley I feel most grateful. His weekly visits to the institution bespeak his interest in the hospital and afford the resident staff the only means by which they may have expert advice on the mental status of cases under treatment. Dr. W. B. Cornell, secretary of the Maryland Society for Mental Hygiene, has shown us many courtesies and has aided us very much by his interest in the place and by securing information about, and employment for, several patients for whom we have asked his consideration.

Most respectfully yours,

KENNETH B. JONES,
Physician-in-Chief.

REPORT OF THE PHYSICIAN IN CHARGE OF THE MUNICIPAL TUBERCULOSIS HOSPITAL

BALTIMORE, December 31, 1913.

To the Supervisors of City Charities:

GENTLEMEN—I beg leave to submit herewith the report on the Municipal Tuberculosis Hospital for the year ending December 31, 1913. During the past year there has been treated in the Hospital, for varying periods, a total of six hundred and sixty-five patients—a decrease of fourteen as compared with 1912. Of these six hundred and sixty-five patients, two hundred and sixty-one were discharged, two hundred and sixty-one died, and there were one hundred and forty-three patients in the hospital on December 31.

DEATHS.

During the past year, the number of deaths increased forty-seven, as compared with the year previous, and our mortality increased to 39.2 per cent. This increase in mortality and decrease in number of patients treated was undoubtedly due to the fact that the State Sanatorium—a 200-bed hospital for "advanced" cases—opened in October, 1912, with a result that during 1913 the more hopeful and earlier cases went to the State Sanatorium, which class we had in the past treated, as there were practically no accommodations for them elsewhere. The increased number of beds for "advanced" cases, due to the opening of the State Sanatorium, has resulted, temporarily at least, in doing away with a waiting list; as a patient can now be admitted immediately to the Municipal Tuberculosis Hospital; and, as a result of it, during the past year the patients who have sought admission have, in many cases, been practically moribund, as shown by the fact that sixty-one of the patients who died were in the hospital less than ten days, and an additional sixty-four were in the hospital less than one month.

DISCHARGES.

The number discharged in 1913 was two hundred and sixty-one, as compared with three hundred and eight in 1912. Among those discharged, one hundred and five gained an average of nine pounds in weight, with a maximum gain in one case of forty-three pounds; fifty-six lost an average of six pounds, and there were seventy-two of whom there is no record of gain or loss, due to the fact that they were in the hospital less than one month. Of those discharged, twelve had the disease apparently "arrested," one hundred and six were improved, while one hundred and thirty-three were unimproved. The cost of running the hospital, including all expenses, save the interest on the investment, was, during 1913, a trifle under sixty-one cents.

Our low cost is, in a great measure, due to the running of the hospital in conjunction with a large general hospital, almshouse and hospital for the insane, thereby decreasing our administration cost to a minimum, and saving by the use of unpaid labor, where possible, from the almshouse and the hospital for the insane. The cost per capita per day for the years 1909 to 1913, inclusive, was forty-nine cents, fifty-three cents, fifty cents, fifty-four cents and sixty-one cents. As the per capita cost per day in all hospitals in the United States devoted to the treatment of patients suffering with advanced tuberculosis of the lungs is on an average well above a dollar a day, it can well be seen that our cost is too remarkably low; and if, in the future, the work is to increase and improve to a proper standard, the cost must increase greatly, even with the advantages that we possess.

During 1913 there was built at a distance of one hundred and fifty feet from the hospital a bungalow for the use of the resident physicians, thus enabling them to be in close proximity to the hospital, and, on that account, better able to attend to their duties to an advantage, not only to themselves, but especially to the patients. There was given to the patients at Christmas time six dozen canvas reclining chairs and blankets by a small group of charitable workers known as the "Fidelis Circle," and this gift was of especial value, as the patients heretofore had only wooden benches to sit on when taking the "outdoor open-air" treatment.

The breadth of the medical work in the Municipal Tuberculosis Hospital can be well shown by the following non-tubercular diseases which were among the complications of the tuberculosis for which the patients were treated at the hospital: Valvular lesions of the left side of the heart, myocarditis, acute endocarditis, chronic parenchymatous and interstitial nephritis, uræmia, asthma, myxodema, aneurism of the aorta, syphilis, leukemia, typhoid fever, Raynaud's disease, cholecystitis, appedicitis, locomotor ataxia, malignant tumors and two obstetrical cases. Of course, there were the usual tubercular complications of other organs than the lungs. Complete autopsies were performed in forty-two instances.

Statistical Tables.

I have appended six statistical tables—five of them dealing with the deaths and discharges for each of the years from 1909 to 1913, inclusive. A study of them will show matters of interest, and also will aid in directing the future necessary improvements. The sixth and last table shows the deaths from tuberculosis in Baltimore by color and sex, and also the deaths by color and sex at the Municipal Tuberculosis Hospital for each of the five years from 1909 to 1913, inclusive; and also the deaths of Baltimoreans at other tuberculosis sanatoria in Maryland. You will notice that during this period the percentage of adult Baltimoreans dying of tuberculosis, who died in special tuberculosis hospitals, increased from 16.8 per cent. to 26.8 per cent., and I have no doubt that this increase in the segregation of the dying consumptives will in the future play a large part, not only in decreasing the mortality of the disease, but also the morbidity.

RECOMMENDATIONS.

The steadily-increasing number of moribund patients admitted to the hospital requires increased facilities for proper nursing, and as most of these patients are men, there is need of good orderlies. Heretofore, we have been allowed fifteen dollars a month for each orderly, and during 1914 we have been allowed twenty dollars, which is from ten to twenty dollars less a month than is paid by other hospitals in the city. Such salaries can attract only inferior men, who will be unsatisfactory and who, consequently, will not remain. On that account, I most urgently recommend that the present salaries be markedly increased.

We have at present a sufficient number of graduate and undergraduate trained nurses, but we badly need a supervising night nurse, such as they have at the general hospital. She should be a trained nurse of broad experience; and, to obtain a satisfactory nurse to fill this arduous position, requiring continuous duty at night, it is necessary to pay a somewhat larger salary that is paid to the graduate ward nurses now employed. I would, therefore, recommend that the position of night supervising nurse be created, and that the salary should be fifty dollars a month, which is ten dollars more a month than is now paid to our graduate ward nurses.

The need of a dish-washing machine becomes steadily more necessary, owing to the growing difficulty of getting labor from the almshouse, as one man can do the work with a machine which is now done by many. The fact that a dish-washing machine would sterilize the dishes used by the patients is in itself one of the strongest arguments for its need in a hospital devoted to the treatment of a *communicable disease*.

I would again call attention to the urgent need of individual lockers for patients' clothes, which they at present keep exposed on the shelf of their bedside table or on hooks in the ante-room to the dining-room.

The appearance of the floors of the hospital is, to say the least, unsightly, owing to their constant cleaning with carbolic acid solution; and, what is more important, they are unsanitary. I would recommend that the floors be covered with some non-absorbent substance, such as is used in modern railway waiting-rooms, which can be mopped frequently and kept clean with a minimum of labor. The scraping and waxing of the floors, in my judgment, would be unsatisfactory, as it requires a great deal of rather hard manual labor to keep such floors in proper condition; and, while we have many patients who are capable of using a light mop on a floor without detriment to themselves, we have practically none who can use the heavy stone polishers necessary for waxed floors.

As our kitchen is situated some little distance from the hospital and on a different level from the dining-room, the food containers must be carried by hand through the open air, thus exposing not only the food, but the waiters, to bad weather conditions at times. On account of the above, I would recommend that the present areaway at the east end of the hospital be extended to the kitchen building and roofed over, so that a truck may be used for taking the food directly from the kitchen to the dining-room and thereby decreasing the number of men needed, and it would also do away with the exposure of the food and the employee to weather conditions.

Frequently during the past year we have had a shortage of bed linen, owing to the fact that in order to dry our linen we must hang it outdoors, or else send it to the general laundry, which is incapable of handling it promptly. As this has been a matter of written complaint by one patient, and recognized as a justified complaint by those in authority at the hospital, I would strongly urge that the room formerly used in the present laundry building as a morgue be converted into a drying rom for laundered clothes.

Two rolling stretchers are badly needed for the conveying of "bed patients," as we have none at present and must depend upon wheel chairs, which is not only unsatisfactory, but at times definitely dangerous to the patients. A third rolling stretcher should be obtained for conveying the dead bodies from the hospital to the morgue.

The porches on the west side of the hospital are at present the only ones not screened and I would recommend that they be screened, also that the sleeping porch of the doctors' bungalow be screened.

Last year none of the entrants for the competitive examinations applied for positions in the tubercuolsis hospital. Although positions were offered to those who failed to get appointments in the general hospital, none accepted, and it was only by great effort and personal solicitation of former students that three assistant resident physicians were obtained. The condition last year was not exceptional, and I believe that for many years to come there will be great difficulty in obtaining doctors to act as internes in a tuberculosis hospital, as they feel that the experience they gain is in too narrow a field; and, in addition, there is a distinct, though in my opinion unfounded, fear that the work is dangerous. In order to get internes extra facilities must be offered to induce them to do this work, and I would recommend that a first-class X-ray plant be installed in the tuberculosis hospital, so that each case could be studied with a fluroscope without danger, either to the patient or to the doctor, and undoubtedly this would be of benefit in the treatment of certain cases, such as those requiring artificial pneumothorax. The need of an X-ray plant has been dwelt upon in previous reports of the physician-in-chief and surgeon-in-chief of the general hospital, and I think that by establishing such a plant in the Municipal Tuberculosis Hospital their need would be, in a large measure, met, as the cases requiring X-ray pictures in the medical or surgical departments could be sent across to the tuberculosis hospital readily, and the two hospitals are only about two hundred yards distant from each other.

The above recommendations are urgent; and, on account of their urgency, I will not, at this time, recommend many minor things that would aid in the treatment and comfort of the patients, but I would suggest that you consider the question of providing additional accommodations for tubercular patients; and I would recommend that if a new hospital is constructed, it should be an exact duplicate of the present general hospital, so that in the future, should there be a decreased need in hospital beds for consumptives, it could be used as a general hospital in conjunction with the present unit.

I desire to take this opportunity of thanking my assistants—Dr. Callahan, resident physician; and Drs. Neistadt, Sparck and Wilkins, assistant resident physicians—for their most excellent work during the past year.

I also desire to thank Miss Smith and the nurses under her for their capable work in the care of the patients.

The active co-operation of the Health Department, and especially the nurses of the Tuberculosis Division, is acknowledged with thanks.

In addition to the tables appended to this report, I have added our usual diet list and a brief history and description of the hospital.

Respectfully,

GORDON WILSON, M. D.,
Physician-in-Charge.

HISTORY.

The Municipal Tuberculosis Hospital might be said to have been started in 1890, as in that year a separate ward was established in the Bay View Hospital for patients suffering with tuberculosis of the lungs. This was, I think, *the first attempt in this country to have a separate ward, in a general hospital, for tuberculosis patients on account of the knowledge of the fact that this disease is communicable.*

In 1903 the city appropriated $10,000 to build a hospital for consumptives on a plot of ground adjoining Bay View, and at a distance of a quarter of a mile from the main building. This hospital was opened on December 19, 1904, with forty-eight patients. Since then a separate kitchen building and laundry building have been erected, and there has been added a wing to the hospital. So far there has been expended about $60,000, which includes the new, deep, screened porches along the front of the building.

The hospital is a brick building a hundred and fifty feet long, two stories in height, with a basement whose floor is three feet below the level of the ground. The entrance is in the center of the south side, and extending from it the full length of each floor are porches, roofed and screened, on which are the beds of those who are sufficiently strong to sleep out in all sorts of weather. Extending back from the center of the north side is a T-shaped wing with deep covered porches on either side. In this wing are the isolating rooms for delirious or dying patients, doctors' and nurses' offices, laboratory, examining rooms and toilets, separate facilities being provided for each sex and color.

There are accommodations for 200 moderately and far advanced cases of pulmonary tuberculosis.

In addition to the buildings described above, there are two small buildings in close proximity to the main building, one of which is the nurses' home, and the other a home for the physicians.

The nurses' home is a two-story brick building, surrounded on three sides by broad, screened sleeping porches, and has accommodations for twelve undergraduate and four graduate nurses.

On the opposite side of the hospital from the nurses' home is the resident physicians' bungalow, a small one-story frame building with a broad sleeping porch, constructed during 1913, and capable of accommodating comfortably six physicians.

MUNICIPAL TUBERCULOSIS HOSPITAL, BALTIMORE, MD.

DAILY BILL OF FARE.

Breakfast, 6.30 A. M.—Oatmeal, hash or eggs, bread, butter, milk, coffee and tea. (Eggs to be served alternately in various styles.)

Morning Diet, 9 A. M.—Milk, 5 oz., and one raw egg.

Dinner, 11.30 A. M.—Beef on Monday, Tuesday, Wednesday, Thursday and Saturday; mutton on Friday; bacon on Sunday; two vegetables each day from the following list: potatoes, tomatoes, turnips, lima beans, cabbage, rice, navy beans, spinach, onions and hominy; bread, tea and coffee; chicken soup on Saturday, another soup once a week.

Afternoon Diet, 2 P. M.—Milk, 5 oz., and one raw egg.

Supper, 4.30 P. M. Bread, butter, coffee, milk, tea, molasses, crackers and cheese twice a week; stewed fruit when cheese is not furnished; corn bread on Fridays.

Night Diet, 8 P. M.—Milk and raw egg. (For "bed patients" only.) Soup every day for "bed patients"; beef tea, custard, roast potatoes, steaks, etc., when specially ordered by physician.

Hospital capacity is 100 beds and when "running full" 200 quarts of milk and forty dozen eggs are used daily.

THE CARE OF THE TUBERCULOUS POOR, WITH RECOMMENDATIONS.

At present the Supervisors have the following beds for tuberculosis patients:

1st—The Municipal Tuberculosis Hospital, Bay View grounds, for white and colored; capacity, 200 beds.

2nd—State Sanatorium, incipient and advanced cases, white; fifty beds.

3rd—Eudowood, incipient and advanced cases, white; ten beds.

4th—Hebrew Consumptive Hospital, incipient and advanced cases, white; six beds.

STATE SANATORIUM.

In 1913 incipient and advanced cases were sent to the State Sanatorium, and the city kept constantly filled the fifty beds, with a "waiting list" at all times.

During 1913 192 patients were treated at the State Sanatorium for varying periods.

EUDOWOOD.

In 1913 the city has kept filled at Eudowood five beds in the advanced hospital, and five beds in the sanatorium, divided as follows: three beds for men and two beds for women in the hospital for advanced cases, and three beds for women and two beds for men in the division for incipient cases.

During 1913 city patients to the number of thirty-four were treated.

At all times during the year there has been a long "waiting list" of patients desiring to go to the advanced hospital.

HEBREW SANATORIUM.

Six beds at this Sanatorium were filled throughout the year with advanced cases chiefly.

During 1913 thirteen patients were treated at the Hebrew Sanatorium at the expense of the city.

With reference to the Municipal Tuberculosis Hospital, any case was admitted to the Hospital at request, as long as there were vacancies, and when the wards were full a waiting list was kept and patients admitted according to their position on the waiting list; the only exceptions being that moribund patients and those without homes were admitted out of order.

Once a week patients applying for the different sanatoriums were examined at the City Hall Annex, and those who were unable to go, save as free patients, were assigned to the waiting list of the different sanatoriums.

During the past year these waiting lists have been held to strictly, and no patient has gone to a sanatorium as a city patient out of turn.

The policy of the Board is to send its incipient and moderately advanced cases to the State Sanatorium, its Jewish patients to the Hebrew Sanatorium, its far advanced cases to Eudowood, and use the Municipal Tuberculosis Hospital for all patients not included above and for such as are on the waiting list of the sanatoriums, but who have to wait some time on account of their position on the list.

In view of the short distance between the City of Baltimore and Eudowood Sanatorium, I would recommend that a larger number of beds be contracted for at that Sanatorium to care for the bed-ridden and dying consumptives, so that they may be visited at frequent intervals and at short notice by their relatives. During 1913 fifty-seven Baltimoreans died at the State Sanatorium, and as this Sanatorium is two hours by railroad it was practically impossible for these patients to see their families frequently, which could have been done had they been at Eudowood.

Respectfully,

Gordon Wilson, M. D.
Tuberculosis Medical Director.

Deaths of Baltimoreans from Tuberculosis at Other Sanatoria in Maryland—1909, 12; 1910, 25; 1911, 39; 1912, 50; 1913, 78.

Total Deaths from Tuberculosis in Baltimoreans—1909, 1,412; 1910, 1,390; 1911, 1,383; 1912, 1,396; 1913, 1,414.

Percentage of Baltimoreans Dying in Special Tuberculosis Hospitals, as Compared With All Tuberculous Deaths—1909, 15.2 per cent.; 1910, 17.5 per cent.; 1911, 18.4 per cent.; 1912, 18.8 per cent.; 1913, 23.9 per cent.

Percentage of Baltimoreans Dying in Special Tuberculosis Hospitals, as Compared With All Tuberculous Deaths (Children Under 15 Years of Age Excluded)—1909, 16.8 per cent.; 1910, 19.3 per cent.; 1911, 20.6 per cent.; 1912, 21.9 per cent.; 1913, 26.8 per cent.

PRESENT POLICY OF THE SUPERVISORS OF CITY CHARITIES WITH TUBERCULOSIS SANATORIUMS HAVING "CITY BEDS."

First.—Those patients on the city list shall remain on this list so long as the superintendent of the sanatorium shall wish, not to exceed a total stay of more than six months, after which time the patient shall not be eligible for a city bed at the sanatorium.

Second.—As vacancies occur they shall be filled *in order* from the waiting list, duplicate copies of which shall be kept by the superintendent and by the agent of the Supervisors of City Charities.

Third.—An applicant for a city bed shall present an application filled out to the Tuberculosis Medical Director at the Supervisors' office in the City Hall Annex, on any Wednesday morning at 9 o'clock. If the applicant is a patient of the sanatorium at time of application, it shall not be necessary for him to present it is person. but he can mail it with endorsement of the superintendent to the agent of the Supervisors, and his name will be entered on the waiting list.

Fourth.—The agent of the Supervisors will accept without further medical examination an applicant for the sanatorium when endorsed on appended blank by the superintendent of this sanatorium, and his name will be entered in its regular order on the waiting list for this sanatorium.

Fifth.—When the agent of the Supervisors shall enter a name on the waiting list for the sanatorium, he will also mail to the superintendent of the sanatorium the name of the said applicant, together with such particulars about him as may seem necessary.

Sixth.—Once a month the agent of the Supervisors will mail a copy of his waiting list to the superintendent, to avoid errors.

Seventh.—If it is so desired, a separate waiting list for each sex will be kept, and a separate list for incipient and for advanced cases, this to be carried out only at the request of the superintendent, and if carried out there shall be a definite division of the total number of beds, both with reference to sex and to the stage of the disease.

Eighth.—No patient shall be eligible for a city bed at a sanatorium who has had in the past the benefit of sanatorium treatment.

TRANSPORTATION OF THE DESTITUTE

This transportation fund is not intended to be used indiscriminately for the traveling expenses of the poor. It is only used for sending away from the city persons who are already charges or likely to become charges upon charity or upon the city, and for the purpose of sending them only to those places where inquiry made by our clerks shows they have work assured them or relatives or friends ready to care for them. If suitable cases, they are then sent to such places, no matter how distant. A large number of applicants either cannot or will not give any references from the place in which they claim to belong. Able-bodied men are rarely given transportation, and every effort is made to secure reimbursement from friends or relatives when possible.

No hardship falls on the applicants pending inquiry, as they are cared for, if destitute, by some co-operative charity, or at the almshouse. The amount of the fund expended yearly has not increased, but is about one-half and sometimes only about one-third of what was expended some years ago, before the Supervisors took charge of this branch of the work. Every applicant is dealt with carefully and considerately, with a view to transporting him to his home, if it is wise to do so.

George Schuster,

Chief Clerk Supervisors of City Charities.

TEMPORARY CARE OF HOMELESS MEN

Since the old custom of allowing men to lodge in the police stations was wisely abandoned, the Friendly Inn Association has undertaken to give food and lodging to homeless men in return for work. The Association offers more comfortable and sanitary care than the police had given or could give. This institution developed as the expression of the feeling of many of our citizens that there should be a place where able-bodied men could secure food and lodging in return for work done by them, and be thus made independent of the alms of the public. Each man has the privilege of a bath, hot and cold water, individual towels, clean night clothing and a clean bed in a comfortable room, the bed linen being changed daily. It is impossible for men of the tramp class to make a rendezvous of this institution, for a tramp will not work, and the rules of the Inn make it impossible for a man to remain longer than three days without special permission from the manager, which means that he must justify his remaining longer, either by showing a disposition to get work or by some other valid reason, each case being dealt with according to circumstances and facts.

The city has been paying the Association under contract the sum of 20 cents a day each for the care of its proportion of beneficiaries. The sum total does not exceed $2,000, the amount expended this year being about $2,000.

The almshouse is too far from the city to be used for admissions late in the day, and an institution like the Inn, whose benefits are earned by work, is the best agency for dealing with homeless men. The exceptional applicants who are too infirm to work are sent the next day by the Inn to the Bay View office.

The Friendly Inn Lodging House provided during the past year 13,061 meals and 7,912 lodgings for work done at the Inn. One hundred and ninety-nine meals and 300 lodgings were given free to those who were physically incapable of work, pending their transfer to Bay View, hospitals or other places suited to their needs. Five thousand eight hundred and twenty baths were taken, 5,820 suits of clothing were fumigated and a number availed themselves of the free use of the laundry. Permanent was secured for 50 and temporary employment for 130.

Some years ago it was decided to extend the time for obtaining food in return for work from 6 P. M. to midnight. This was done in the interest of those who might hesitate to send a hungry man to the Inn during the night hours.

CHILDREN'S DEPARTMENT

During the year ending December 31, 1913, 133 applications were made to have 234 children placed in institutions or otherwise cared for. A number of applications came to us in which the children were not primarily involved and the cases were at once referred to the proper agencies for relief. These, of course, are not included in this report. The recorded applications were disposed of as follows:

	White.		Colored.		Total.
	Male.	Female.	Male.	Female.	
Referred to private charity with hope of keeping the family together or of the family paying board for the children	23	19	14	8	64
Referred to private charity to place in good free private homes	10	15	5	1	31
Parents or relatives found able and willing to care for	25	12	13	8	58
Total not accepted	58	46	32	17	153
Placed in institutions as follows to become city charges:					
St. Vincent's Infant Asylum	10	9	......	......	19
Nursery and Child's Hospital	7	8	......	......	15
St. Elizabeth's Home for Colored Children	......	......	8	5	13
St. Mary's Home for Colored Boys	......	......	3	......	3
Maryland Home for Friendless Colored Children	......	......	5	2	7
Home of the Friendless	3	5	......	......	8
St. Vincent's Male Orphan Asylum	4	......	......	......	4
St. Mary's Female Orphan Asylum	......	7	......	......	7
St. Katherine's Home for Little Colored Girls	......	......	......	5	5
Total accepted	24	29	16	12	81

Of the above 234 children, 41 were illegitimate, 17 white and 24 colored; 17 were abandoned, 11 white and 6 colored, of whom 13 were foundlings, 9 white and 4 colored.

We were summoned by the magistrate for juvenile causes to appear in 63 cases, involving 133 children, 100 white and 33 colored. Parents were allowed to retain 36 of these children, 5 were committed to industrial schools, and 92 were committed as neglected children, 26 to private agencies and 66 to institutions; 63 to become city charges and 29 to be maintained without expense to the city.

Thirty-five children, 30 white and 5 colored, were returned to parents and other relatives. As far as possible, we have kept in touch with parents and relatives of the children under our supervision. Requests came from many of them to have the children returned to their care. After careful inquiry and visitation of the homes, their requests were granted, only where conditions were found favorable to the proper development of the children.

A number of free private homes were offered during the year for our wards. Some were refused as unsuitable. For several there were no children of the age desired. Seventy-nine were accepted after visitation and careful inquiry by correspondence and interview with pastors and physicians and others, and 80 of the children, 56 white and 24 colored, were placed in these homes. In these cases either there are no parents or interested relatives living; or, if living, they offer no hope of ever being able or willing to care for the children properly.

CHILDREN IN FREE PRIVATE HOMES.

	White.		Colored.		Total.
	Male.	Female.	Male.	Female.	
December 31, 1912	127	109	40	14	290

Transferred to relatives	3	3	......	1	7
Transferred to industrial schools	......	3	5	....	8
Transferred to Rosewood State School	......	2	......	....	2
Transferred to training school	......	....	1	....	1
Became of age	7	8	......	2	17
Legally adopted	2	1	......	....	3
Ran away	1	....	2	....	3
	29	38	11	8	86
December 31, 1913	127	98	37	22	284

The parents of the children committed to the institutions have been encouraged to feel their responsibility for the support of their children, even though taken from them in their improper homes, and to contribute something from their earnings toward the board of the children in the institutions. Reimbursement from this source amounted to $135.

The number of deaths among children on the city's list has been as follows:

	White.	Colored.	Total.
In St. Vincent's Infant Asylum	6	....	6
In Nursery and Child's Hospital	7	....	7
In St. Elizabeth's Home	....	11	11
In boarding home	....	1	1
Total	13	12	25

Eighteen of these were under one year of age, 10 abandoned, 9 being foundlings.

One was over one and under two years of age; one was over two and under three years of age; two were over three and under four years of age; one was over five and under six years of age; one was over six and under seven years of age; one was over ten and under eleven years of age.

The following table shows the death rate of the children under two years of age received during 1913:

	Received under 2 years of age.			Died.		
	Foundlings.	Others.	Total.	Foundlings.	Others.	Total.
St. Vincent's Infant Asylum......	2	7	9	1	3	4
Nursery and Child's Hospital......	4	9	13	3	3	6
St. Elizabeth's Home..............	4	7	11	*4	3	7
Total	10	23	33	8	9	17

*One died in boarding home.

Eighteen children, 5 white and 13 colored, were transferred to industrial schools as follows: 1 to St. Mary's Industrial School, 2 to Maryland School for Girls, 2 to House of Good Shepherd, 6 to House of Reformation for Colored Boys, 2 to House of Good Shepherd for Colored Girls, 5 to Industrial School for Colored Girls.

Fourteen children, 13 white and 1 colored, who were found to need special treatment, were transferrd as follows: 3 to tuberculosis hospitals, 9 to Rosewood State School, 2 to James Lawrence Kernan Hospital and Industrial School for Crippled Children.

Four children, 3 white and 1 colored, were transferred to private agencies and will be cared for without cost to the city, as follows: 1 to St. James' Home, 1 to St. Patrick's Orphan Asylum, 1 to Hebrew Benevolent Society, 1 to St. Augustine School, Raleigh, N. C.

Thirty children, 22 white and 8 colored, became of age.

Three white children in free family homes were legally adopted.

Two thousand one hundred and twenty-three visits were made in order to make careful inquiry into the circumstances and needs of 587 children. This includes visits made to free private homes and to boarding homes.

The children who are under the supervision of the Supervisors of City Charities are distributed as follows:

	White.		Colored.		Total.	Rate of Payment per Day, Cents
	Male.	Female.	Male.	Female.		
With payment of board:						
In St. Vincent's Infant Asylum	12	8	......	....	20	23

Without payment of board:	58	86	46	45	235	....
In institutions	17	18	3	1	39	....
In private homes	127	98	37	22	284	....
Total number of children under our care and supervision	202	202	86	68	558	....

As heretofore, in all the destitute children's cases we have endeavored by thorough inquiry to learn first the real needs in each case and then to discover all the resources that could be drawn upon to meet these needs.

THE INSANE DEPARTMENT

Every means is used by the Supervisors to provide care and treatment, as soon as possible, for persons mentally diseased. Prompt treatment is one of the surest means to recovery. While the Supervisors constantly urge upon the State its duty to make more adequate provision for the insane in well-equipped hospitals on extensive grounds, because, as a rule, the State institutions can best care for the insane, we wish to call the attention of the public to the fact that the care and treatment of the insane at Bay View Asylum, which is used at present for many cases, acute as well as chronic, is humane and reasonably efficient, the great need for complete State care is self-evident, not only in the city, but throughout the entire State.

INSANE DEPARTMENT.

Patients were sent to hospitals wholly or in part at the expense of the city as follows:

Hospitals.	White.		Colored.		
	Male.	Female.	Male.	Female.	Total.
City Reception Hospital, Bay View	130	96	57	57	340
Mount Hope Retreat	2	8	......	......	10

AGE OF PATIENTS IN HOSPITAL DURING THE YEAR 1913.

SURGICAL.

AGE.	White Males.	White Females.	Colored Males.	Colored Females.
1 to 10 years	1	....	....	....
11 to 20 years	4	3	11	12
21 to 30 years	15	21	21	14
31 to 40 years	25	10	11	8
41 to 50 years	33	11	12	8
51 to 60 years	48	11	12	8
61 to 70 years	28	7	4	5
71 to 80 years	16	5	1	....
81 to 90 years	3	2	....	2
91 to 100 years	1	....	....	....
Total	174	70	72	59

Total number of cases, 375.

TABLE IV.

NUMBER OF CASES TREATED IN SURGICAL DISPENSARIES.

(January 1, 1913, to December 31, 1913.)

MONTHS.	Male.	Female.
January	541	163
February	426	152
March	359	127
April	220	148
May	186	142
June	143	136
July	178	122
August	255	127
September	214	63
October	118	73
November	287	102
December	259	86
Total	3,186	1,441
Grand total	4,627	

TABLE V.

Medical Diseases Treated, January 1 to December 31, 1913.

Diseases Treated.	Principal Diseases.	Complicating Diseases.	Well.	Improved.	Unimproved.	Not Treated.	In Hospital.	Died.	Autopsy.
Abscess:									
Alveolar	....	1	....	....	....	....	....	....	....
Pulmonary	1	....	....	....	....	....	....	1	1
Subcutaneous	....	2	....	....	....	....	....	....	....
Acne vulgaris	....	1	....	....	....	....	....	....	....

ANNUAL REPORT

OF THE

Superintendent of Public Buildings

TO THE

Mayor and City Council of Baltimore

FOR THE

FISCAL YEAR ENDING DECEMBER 31, 1913

1797

BALTIMORE
MEYER & THALHEIMER
CITY PRINTER

1914

ANNUAL REPORT

OFFICE OF THE

SUPERINTENDENT OF PUBLIC BUILDINGS,

CITY HALL.

BALTIMORE, December 31, 1913.

To the Honorable Mayor and City Council of Baltimore.

GENTLEMEN: I respectfully submit for your consideration my annual report, showing the work performed by this department during the year ending December 31, 1913.

During the past year I have endeavored to place the several buildings under my supervision in the best possible condition so far as the appropriation at my command would permit.

THE YEAR'S SUCCESSES.

During the year several matters of unexpected expenses were saddled upon the department, not one of which could have been foreseen and calculated into the year's requisitions; and yet, by careful management and strict economy, making every dollar produce a full dollar's worth, the department has served and provided everything that seemed to be needed for the various municipal departments.

SPECIAL RECOMMENDATIONS.

There are one or two additions which should be made to the list of employes, which a close examination will demonstrate to be wise and business like.

For instance: The number of watchmen in the City Hall should be increased from four to five. There should be two watchmen in the hall at night and three during the day, in order to give the building proper protection. It is hardly possible for one man to make frequent rounds through the building at night and at the same time keep proper watch at the Holliday street door; that door must be kept open until after midnight. The corridors and several of the rooms should be painted and frescoed.

A general overhauling of the several toilet rooms is needed, as they are far from sanitary.

The elevator of the City Hall should be supplied with greater power.

A public toilet on the first floor is urgent.

Detail of the Year's Work.

The following improvements were made during the year:

City Hall.

I beg to report that the corridor walls on all the floors have been properly washed; all the furniture and floor coverings have been renovated and repaired, and are now in first-class condition.

The Star-Spangled Banner Commission's offices were entirely furnished with new office furniture, linoleum and the walls painted.

The City Forester's office was furnished and painted.

City Hall Annexes.

Annex No. 1—Occupied by the Health Department and Bay View offices, is in a clean and comfortable condition, but by no means attractive in either interior or exterior appearance.

Annex No. 2—Occupied by the Street Cleaning Commissioner, Electric and Free Public Bath Commission, also Topographical Survey, has been thoroughly overhauled and renovated.

These buildings are now lighted by current furnished from the High Pressure Pumping Station.

Court House.

The general condition of this building is good. One unfortunate condition is that several of the departments, under the law, employ their own charwomen, but are not allowed a sufficient number to do the work properly. I have no jurisdiction over the cleaning in these departments, though this fact is not generally known, and I frequently receive censure for what I am not responsible.

The four elevators in the building, and the electrical machinery by which they are run, have been overhauled during the year and are in first-class condition.

This building is now lighted and heated by current furnished from the High Pressure Pumping Station, which is very economical and satisfactory in every respect.

People's Court.

The general condition of this building is good, except the walls, which need painting.

The corridors and two rooms have been covered with linoleum; nine windows furnished with awnings; four fire extinguishers purchased and placed on the walls to be handy in case of fire.

FINANCIAL STATEMENT.

The cost of maintaining the department for the year ending December 31, 1913, was as follows:

Total appropriation for the year 1913		$82,104 41
City Hall, salaries	$17,622 50	
City Hall Annexes, salaries	6,120 00	
Court House, salaries	32,940 00	
People's Court, salaries	2,880 00	
City Hall, expenses	6,200 00	
City Hall Annexes, expenses	7,250 00	
Court House, expenses	6,429 41	
People's Court, expenses	2,625 00	
Total expenditures for the year		82,066 91
Balance		$37 50

CONCLUSION.

In conclusion, I desire to state that in all the improvements inaugurated by this department I have had the hearty support and earnest co-operation of Mr. Clarence E. Stubbs, the Building Inspector, and his able assistants.

Respectfully submitted,

GEO. T. AMES,
Superintendent of Public Buildings.

RULES FOR THE GOVERNMENT OF EMPLOYEES OF THIS DEPARTMENT

1. District Superintendents will patrol the district to which each may be assigned, night and morning, and maintain a thorough and practical supervision over the street lighting system of the city, in order that the very best service may be obtained at all times. They must report all defective street lights in their respective districts and fully explain in their reports the cause of such defects.

2. They must see that the lanterns, globes, bottom glass, street signs and other lamp fixtures are properly adjusted and are kept thoroughly cleaned at all times, and must report any failure on the part of the contractors or their employees to properly perform this work.

3. They must see that the street lamps are lighted each night and extinguished each morning strictly in accordance with the official schedule of lighting issued by this Department, and report any failure of the lamplighters to comply with this requirement.

4. They must thoroughly acquaint themselves with each and every condition in their respective districts bearing upon the work of this Department, in connection with the lighting service, and must make such recommendations as in their judgment will improve the street lighting system.

5. They must keep an accurate account of the number and location of all gas and naphtha street lamps and unused lamp posts in their respective districts, and be prepared to furnish the Superintendent of Lamps and Lighting information as to the exact location of each lamp and unused lamp post.

6. When new street lamps are ordered by the Superintendent of Lamps and Lighting, the District Superintendents must see that they are placed in the exact location as ordered, and that the pavement at the base of each post is put in proper condition and report in writing to the Department when these lamps go into service. Lamps should not be placed against trees, telegraph or telephone poles.

7. They must keep an accurate account of all street lighting equipment, and must specify that portion of it that belongs to the city and

that owned by the contractors. They must report to the Department all broken or wrecked lamp posts and fixtures found in their respective districts, and see that all needed repairs are promptly made by the contractors, including the repair of the pavement at the base of all posts.

8. They must see that all the street signs which are attached to houses in the electric light districts of the city are properly adjusted, and must report to the Department any such signs that may be found hanging or out of place—giving the location where such signs are to be found.

They must report to the Department the necessity for street signs in such localities of their respective districts, where, in their judgment, the convenience of the public may demand, and must specify whether for street lamps, houses or unused lamp posts, giving the location where such signs are to be placed.

9. The District Superintendents will be required to make a lamp-to-lamp inspection every three months during the year, and must report all defects found and all repairs needed.

The method of this inspection must be conducted in the day time, and with the assistance of the lamplighters.

The District Superintendents, with the assistance of the lamplighters, will examine, in the most thorough manner, each street lamp, and must carefully note and report every defect found in connection with the lantern, burner and lamp post. They must note and report every lamp post found to be leaning, and report any defects found in the pavement at the base of each lamp post. They must also report the necessity for painting the lamp posts and fixtures.

After this inspection has been made, and the reports, setting forth the necessary repairs to be done, submitted to the Superintendent of Lamps and Lighting, the District Superintendents must follow up this work, and see that all repairs are made by the contractor in a manner satisfactory to the Department.

10. They must acquaint themselves with and keep a correct record of the location of all stores dealing in and selling at retail, coal oil, in their respective districts, and must collect at least three samples of coal oil each day from different dealers. They must also collect samples of oil from the delivery wagons of all companies and persons engaged in selling oil to local dealers.

11. They will be required to take monthly statements or readings of gas and electric meters located in all municipal buildings, markets, etc.

12. Any District Superintendent who may be found guilty of any irregularities in connection with the collection of samples of oil will be promptly dismissed.

13. District Superintendents must report to the Department each morning not later than 9.30 o'clock.

14. Any District Superintendent who fails to comply with these rules in any particular will be dismissed.

INSPECTOR OF ILLUMINATING OIL.

The Inspector of Illuminating Oil will make all inspections of illuminating oil strictly as required by the provisions of the law bearing upon the subject.

He must inspect at least twenty (20) samples of oil daily.

He must keep a correct record of all tests of oil.

He must also perform such other duties as may be ordered from time to time by the Superintendent of Lamps and Lighting.

CHIEF INSPECTOR.

The Chief Inspector must keep a general supervision of the gas, naphtha and electric arc light service throughout the city, ascertain the cause of all defective lights, and where it is within his power to do so he must correct the cause of the trouble; otherwise he must call the contractor's attention to the existing defects that the same may be adjusted promptly.

He must recommend any alterations or repairs of the lamps which he may find to be necessary for the improvement of the general lighting service. He must superintend the erection of all additional electric, gas and naphtha lamps which may be ordered from time to time throughout the city, and also superintend all alterations, repairs and readjustments of such lamps and equipment, and must report to the Department any failure on the part of the contractors or their employees to execute the work properly.

He must perform any other service that may be ordered from time to time by the Superintendent of Lamps and Lighting.

CLERKS.

The clerical force will be required to transact the routine business of the office; enter and keep a correct record of installation, transfer and discontinuance of the various types of lamps in service in the books provided for this purpose and to do such other clerical work as may be ordered by the Superintendent of Lamps and Lighting.

GENERAL RULES FOR THE GOVERNMENT OF ALL EMPLOYEES OF THE DEPARTMENT

1. Any employee of this Department who shall solicit contributions of money or material of any of the contractors doing work for the city through this Department, or from any other person employed by the contractors, either as a loan or otherwise, will be dismissed at once.

2. Any employee found under the influence of liquor, or who may be negligent or insubordinate, or in any way interfering with or obstructing the work of this Department, shall be suspended pending an investigation.

3. Any employee who shall absent himself from work without good and sufficient cause will be dismissed.

4. Any employee who shall fail to comply with any of the rules which apply to his particular work will be dismissed.

5. Employees must not, under any circumstances, entertain visitors or friends during office hours on other than business connected with the Department.

6. Any employee who shall make a misstatement, or who shall falsify his report as to his particular work, will be dismissed.

7. Employees must treat all persons having business with the Department with courtesy, and must conduct themselves with proper decorum at all times.

8. Employees must carefully read the foregoing rules and familiarize themselves with them.

REPORT OF THE SUPERINTENDENT

OFFICE OF
SUPERINTENDENT OF LAMPS AND LIGHTING,
CITY HALL,
BALTIMORE, January 1, 1914.

To the Honorable Mayor and City Council of Baltimore.

GENTLEMEN—I have the honor to submit my annual report for the year ending December 31, 1913—my thirteenth since assuming charge of the Department, and the thirty-third since its establishment.

The amount of work performed during the year has been greater than that done in any preceding year in the history of the Department, due entirely to the increased work of street improvements necessitating the installation and rearrangement of an exceedingly large number of street lamps of all kinds, together with our usual supervision of the work of the street lighting contractors.

The various subjects with which this Department has had to deal during the year are described under the proper headings following.

NUMBER OF STREET LAMPS OF ALL KINDS IN SERVICE.

At the close of the year 1913 there were in service street lamps of all classes as follows:

Incandescent gas lamps	9,319
Incandescent naphtha lamps	324
Incandescent electric lamps (40 candle-power)	901
Incandescent electric lamps (ornamental type)	365
Ornamental luminous arc lamps (underground service)	416
Electric arc lamps (old type underground service)	890
Electric arc lamps (old type overhead service)	1,574
Total number of lamps in service December 31, 1913	13,789

Lamp Equipment—Property Of.

The city owns all the ornamental luminous arc lamps and fixtures comprising the "White Way" districts, the ornamental lamps and fixtures located on the North Baltimore boulevards, gas lamp posts and lanterns, except a number of boulevard lanterns and the patent lamp burners, which are the property of the American Street Lighting Company. All other lamps and fixtures are the property of the several contractors.

Street Lamps—How Maintained.

The street lamps are operated and maintained under contract by private corporations, except the ornamental tungsten lamps located on Charles street, University Parkway and Thirty-ninth street and on the streets surrounding the Western Female High School and the Polytechnic Institute, which lamps are owned by the city and are operated and maintained by this Department direct; the current being supplied by the Gas and Electric Company by meter measurement.

The lamps on the City Hall Plaza are also operated and maintained by this Department; the current being supplied from the High Pressure Pumping Station on South street.

Cost of Maintaining the Street Lamps.

The cost for the maintenance of the street lamps is at the following rates:

Incandescent gas lamps, including the supply of gas, each lamp per annum	$18 10
Incandescent naphtha lamps, each lamp per annum	24 00
Incandescent electric lamps (40 candle-power), each lamp per annum	20 00
Ornamental luminous arc lamps (underground all-night service), each lamp per annum	89 00
Electric arc lamps (old type; underground half-night service), each lamp per annum	81 00
Electric arc lamps (old type; underground all-night service), each lamp per annum	74 00
Electric arc lamps (old type; underground half-night service), each lamp per annum	68 00

Electric arc lamps (old type; overhead service), each lamp per annum	$60 00
Incandescent electric ornamental lamps, sixty (60) candle-power, owned and maintained by the city, each lamp per annum	14 75
Incandescent electric ornamental cluster lamps sixty (60) candle-power, City Hall Plaza, owned and maintained by the city, each lamp per annum (less the supply of current)	7 13

It will be noted that the lamps owned by the city are of a sixty (60) candle-power capacity and are operated and maintained by the city considerably cheaper than are the lamps of forty (40) candle-power capacity which are owned, operated and maintained by the Gas and Electric Company under contract.

The prices of $14.75 and $7.13, respectively, include allowance of five per cent. (5%) for depreciation and five per cent. (5%) interest upon the investment.

Extension of the Street Lighting Service.

During the year there has been installed and placed in service fourteen hundred and sixty-five (1,465) additional lamps of all classes; eight hundred and thirty-five (835) gas lamps erected and connected up, including curb service connections and four hundred and forty-nine (449) subway connections for the accommodation of underground arc lamps—all of which lamps will be set up and placed in service during the year 1914. This work was entirely due to the new paving being done under the several departments having supervision of this character of work.

Extension of the Ornamental Lamp Service.

The "White Way" system of street lighting was extended by the installation of twenty-five luminous arc lamps and ornamental standards on St. Paul street, from the Court House Plaza (Lexington street) to Centre street, a distance of five squares; also on the Fallsway, from Gay street to a point south of Bath street, and at various points on streets in the business section.

An ornamental system of tungsten electric lamps was installed on Lafayette avenue, Madison avenue, McCulloh and Lanvale streets, surrounding the Western Female High School, and a similar system was installed on North avenue, Calvert, Twentieth and Barclay streets surrounding the Polytechnic Institute; also on streets surrounding the Sewerage Pumping Station and the Recreation Pier. These lamps are lighted and extinguished automatically by means of a time-switch, half of these lights being extinguished at midnight and the remainder at dawn. These lamps were installed by the Department at a cost of approximately fifty per cent. (50%) less than by contract.

LAMPS OF ALL CLASSES TRANSFERRED.

Due to the operations of the various municipal departments having to do with all kinds of improvements on the public streets, and for the betterment of the street lighting service, it became necessary during the year to transfer two hundred and forty (240) gas lamps, seventy (70) electric lamps and five (5) naphtha lamps.

LAMPS OF ALL CLASSES DISCONTINUED.

On account of the substitution of one kind of lamp for a different one in order to suit conditions existing at various points throughout the city, and for the accommodation of street improvements in certain sections, one hundred and eighty-two (182) gas lamps, sixty-four (64) electric lamps and eighty-eight (88) naphtha lamps were discontinued from the service during the year.

SUBSTITUTION OF ONE KIND OF LAMP FOR ANOTHER.

The gas mains having been extended in a number of streets in the city proper, as well as in the outlying sections, we have been enabled to substitute thirty-three (33) naphtha lamps for as many gas lamps, and three (3) naphtha lamps for as many

40 candle-power incandescent electric lamps, thus greatly improving the lighting system on the several streets affected by this change at a considerable reduced cost.

Electric Lamps Transferred From Overhead to Underground Service.

The subway conduit system having been extended during the year, fifty (50) arc lamps were transferred from the overhead to the underground service, with the result that an additional number of unsightly poles and overhead wires will be eliminated from the public streets and alleys.

Lamps Placed in Alleys.

The very great and urgent demand on the part of the public for lamps in alleys is evidenced by the fact that one hundred and fifty-five (155) incandescent electric lamps were installed in rear alleys in different sections of the city during the year, in addition to which there are on file in the Department applications for approximately five hundred (500) of these lamps which had to be refused, owing to the limited number allowed for this purpose.

Indeed, it seems that the people are more desirous to have dark alleys lighted than they are the streets, on account of the danger of house-breakers and burglars who, under the cover of darkness existing in these alleys, enter dwellings from the rear for the purpose of robbery.

Playgrounds Lighted.

As usual, a number of playgrounds were properly lighted during the year for the convenience of those who use these grounds for athletic and outdoor exercises.

New Street Signs Erected and Repaired.

The changing of street names, opening of new streets, and the discarding of old and worn out street-name signs—eight hundred and eighty-nine (889) new street signs of all description were erected, thus designating the names of a very large number of streets located in all sections of the city. One hundred and sixty-six (166) bracket and house street-name signs and fixtures were repaired and painted.

"Hospital Zone" Signs Erected.

As required by ordinance, as directed by the Health Commissioner, who furnished plats showing the streets forming hospital zones, forty-three (43) zone signs were installed at proper points designating the outer limits of the several zones selected by the Health Commissioner around the following named hospitals: Baltimore Ear, Eye and Throat; United States Marine, Maryland Homeopathic, St. Vincent's Infant Asylum, and Dr. Howard Kelly's Sanitarium.

Wrecked Gas Lamps.

There were forty-six (46) gas lamps wrecked during the year, due to carts, trucks or heavy wagons having run into these lamps, caused in the main by reckless and indifferent driving. These lamp posts and fixtures were repaired and replaced, as the extent and condition of the damage required, by the contractor, without cost to the city; the new lamps and fixtures, under the terms of the contract, becoming the property of the city. The contractor, however, is permitted to collect from the person or persons who may have been responsible for the damage the actual expenses involved.

Street Lamp Repairs and Alterations of All Kinds.

Street lamps, lanterns and fixtures, which through wear and tear became damaged, have been repaired and alterations made in this equipment from time to time during the year as follows:

Boulevard globes changed to ornamental	281
Miner globes changed to boulevard	233
Miner globes changed to ornamental	33

Lamp domes replaced	113
Lamp draft tubes replaced	99
Lantern repairs	189
Lamp-post repairs	262
Telegraph, telephone and trolley poles transferred for new street lamps	28
Pavement repairs at base of lamp-posts	189

Collecting and Testing Coal Oil.

The work of collecting and testing samples of coal oil, as required by ordinance, was, as usual, done by the force of the Department during the year.

A total of six thousand two hundred and ninety-seven (6,297) samples were tested in the laboratory and in no case was the oil tested found to be below the legal standard and flashing point of 120 degrees Fahrenheit.

Gas and Electric Meter Readings.

As required by ordinance, all gas and electric meters used in all city departments and public places were read by the District Superintendents each month during the year, amounting to 8,136 individual readings. Thus it is made possible to determine the exact and correct quantity of gas and electric current consumed by the city during the year. These readings are recorded each month and are used also to verify the correctness of the bills of the Gas and Electric Company for the supply of gas and electricity.

Night Inspections.

The usual night inspections have been maintained during the year by the District Superintendents for the purpose of keeping a strict supervision over the service to see that the standard of light required by the terms of each contract is maintained during the hours of burning and to report any neglect on the part of the contractors which may result in defective lamp service.

Lamp Posts and Fixtures Painted.

Gas and naphtha lamp posts and fixtures throughout the city to the number of nine thousand five hundred (9,500) were thoroughly overhauled, repaired and painted during the year. This work was done by the American Street Lighting Company, under the terms of the contract, without any cost whatever to the city.

Ornamental Lamp Globes Take Place of Old Type.

The old style of "Boulevard" lamp globes were exchanged for the very latest ornamental design of lamp globes surmounted with neat copper ventilators, and carved cast iron lamp post extensions were placed on all gas lamps located on Broadway, from Baltimore street to North avenue; Eutaw Place, from Dolphin street to North avenue; Read street, from Cathedral to Calvert street; Lombard street, from Chester street to Patterson Park avenue, and on Mount Vernon Square, from Cathedral to St. Paul streets.

This new globe is the very latest type of street lamp fixture, and presents a very neat and artistic appearance, so much so that there is a demand for these globes from citizens in all sections of the city. At present, however, we are placing them on lamps located in the public parked squares.

These new globes and lamp post extensions were furnished and attached to the lamp posts by the American Street Lighting Company without any expense whatever to the City of Baltimore.

New Contracts Awarded.

Electric Street Lighting Service; Electric Current and the Supply of Gas.

New contracts for and in connection with the street lighting service were awarded by the Board of Awards during the year as follows: To the Conoslidated Gas Electric Light and Power Company, for the maintenance of the electric arc and incandescent street lamps of all kinds, for the supply of electric current for use in all municipal buildings and other public places; and for the supply of gas for use in all street gas lamps and in all municipal buildings.

The prices for the several classes of service mentioned above are the same as prevailed under the preceding contracts, except that for the supply of gas for use in the street gas lamps. The price under the new contract is 67½ cents per 1,000 cubic feet, and for use in all municipal buildings the price is 75 cents per 1,000 cubic feet, a reduction, when compared with the prices under the preceding contract, of 2½ cents and 5 cents per 1,000 cubic feet respectively, and a saving to the city of approximately $4,000 per annum. This contract was awarded for a term of one year, beginning September 13, 1913.

Owing to a disagreement between the Gas and Electric Company and the city as to charges for material used in the transfer and alterations of electric lamps, this contract has not as yet been executed. The matter of the differences existing is now under consideration by the Law Department, with a view of a satisfactory adjustment in favor of all concerned. In the meantime, the city is paying for the service at the same prices specified in the company's proposal. This contract was awarded by the Board of Awards, October 1, 1913.

Ornamental Lamp Posts.

A contract was awarded to the Morris Iron and Steel Company of Frederick, Md., for ornamental lamp standards—known as the "Baltimore Post"—by which the cost of the large post is reduced from $36 to $18.95, and the small post from $18 to $9.90, or a saving to the city of approximately fifty per cent. (50%). This contract was awarded for a term of one year, beginning April 4, 1913.

Gas and Naphtha Street Lighting.

A contract was awarded to the American Street Lighting Company for the operation of the gas and naphtha street lamps, at the rate for gas lamps of $9.40 per lamp, a saving of $6,000 per annum. Term of contract three years, beginning December 1, 1913.

Electrical Illumination.

A contract was awarded to Eugene I. Rosenfeld & Co. for a design of special electrical illumination in front of the Fifth Regiment Armory and in front of the Maryland Theatre, for the conventions held by the Baltimore Advertising Club and the Fraternal Order of Eagles.

Electric Lamps or Bulbs.

A contract was awarded to the Baltimore Electric Supply Company for the supply of incandescent electric lamps for use in all municipal buildings. The price for these lamps is somewhat less than under the preceding contract.

CITY BRIDGES.

All city bridges have been equipped with an up-to-date system of electric lighting. St. Paul and Calvert Street Bridges are now being changed from the old gas lighting system to that of the tungsten electric. This work is being done under the supervision of the City Engineer, who has charge of all repairs and alterations in connection with all bridges. When he has completed the work of changing the lighting system on these bridges they will be turned over to this Department for operation and maintenance.

The new scheme of lighting on these bridges will be very artistic and will be a vast improvement over the old plan.

The lamps on all city bridges will be lighted and extinguished automatically by means of a time-switch—half the number of lamps on the St. Paul and Calvert Street bridges being extinguished at midnight and the remainder at daylight.

SPECIAL WORK PLANNED FOR THE YEAR 1914.

The "White Way" system of street lighting will be extended on various prominent streets in the business district now unfinished: on Baltimore street, from Fallsway to Broadway; Broadway, from Baltimore street to the Recreation Pier; Fallsway, from Bath street to Biddle street; Key Highway, from Light street to Montgomery street, and such other streets as may hereafter be decided upon, which will involve the installation of approximately four hundred (400) additional modern luminous arc lamps and ornamental standards and which will make a total of eight hundred (800) of these new lamps and standards.

Tungsten electric lamps with ornamental globes and standards will be installed on Charles street, from North avenue to Twenty-ninth street; Charles street, from University Parkway to the city limits; Oak street, from University Parkway to Mallory lane; Washington street, from North avenue to entrance of Clifton Park; on the several streets surrounding the Eastern Female High School and North Avenue Bridge, from Oak street to McMechen street, which will require the installation of approximately three hundred (300) of this class of lamps which, when installed, will make a total of six hundred.

Locations have been selected and plans laid out for the installation of underground electric lamps on Frederick avenue, from Bentalou street to the city limits; Reisterstown road, from Pennsylvania avenue to Park Heights avenue; Hanover street, from Fayette to Winder streets. Locations have also been selected and plans mapped out for the installation of gas lamps on a large number of streets. All of which work is made necessary by reason of the new paving about to be done by the Paving Commission, the Commissioners for Opening Streets, and the Good Roads Commission.

Approximately fifteen hundred (1,500) gas lamps and three hundred (300) electric arc lamps (old type) will be installed on streets in all sections of the city, which makes a total of twenty-five hundred (2500) lamps of all classes to be installed and placed in service during the year 1914.

This great number of street lamps is made necessary by reason of the improved paving planned for the year 1914, the opening of new streets and the extension of existing streets.

SPECIAL ILLUMINATION.

By direction of the Board of Estimates a special illumination was provided for the benefit of the Baltimore Advertising Club in front of the Fifth Regiment Armory, the Fraternal Order of Eagles in front of the Maryland Theatre, and for the colored Knights of Phythias on Druid Hill avenue, between Eutaw and Paca streets.

Those interested in the several events were much pleased for the consideration thus extended by the city, and were quite profuse in their expressions of appreciation.

The expense for this work was, by order of the Board of Awards, paid out of my appropriation for "Electric Lighting and Maintenance."

BUSINESS OF THE DEPARTMENT CAREFULLY CONDUCTED.

As usual, it has been our endeavor to conduct the affairs of the Department during the year in a careful and conscientious manner and to the very best interests of the city.

The books and accounts of the Department have been examined and audited at stated periods by the Baltimore Audit Company and by the auditors of the Comptroller's Department each month during the year, and have been found correct in every respect.

CONCLUSION.

The usual system of co-operation of all other departments has continued during the past year, with the result that the public business has been disposed of without friction.

I desire to thank His Honor and the several department heads for continued courtesies received, and for willing co-operation given.

I also desire to express my sincere thanks to my office force and to the employees of the Department for earnest, conscientious and faithful service rendered by each of them.

Respectfully submitted,

ROBERT J. MCCUEN,
Superintendent of Lamps and Lighting.

SPECIFICATIONS

For Furnishing, Operating and Maintaining Electric Arc and Incandescent Lamps for Lighting the Streets, Avenues, Parks, Squares, Roads, Bridges, Docks, Piers, Lanes and Alleys Within the City of Baltimore.

Separate bids will be received for lighting the streets, avenues, parks, squares, etc., within the city with electricity under the following conditions:

General.

1. Separate bids must be submitted in sealed envelopes marked "Proposals for Electric Arc and Incandescent Lights," and addressed to the Board of Awards, in care of the City Register, City Hall, Baltimore, Md., not later than 11 o'clock A. M., Wednesday, September 3, 1913.

Contract Terms.

2. Bids must be submitted for terms of one, two, three and five years.

3. Bids must be submitted for all arc and incandescent lamps now in service and such additional lamps that may from time to time be ordered to be installed during the term of the contract by the Superintendent of Lamps and Lighting within the corporate limits of the City of Baltimore.

4. All bids must contain two classifications, one for street lighting service in the underground districts including subway duct rental, and one for street lighting services in overhead districts. The classifications shall be considered together as going to make up one bid and not separately, the intent being to award the electric lighting contract to one contractor.

Certified Check.

5. Each bidder must enclose with his bid his certified check on a clearing house bank for five hundred dollars ($500), made payable to the order of the Mayor and City Council of Baltimore. The check of the successful bidder will be returned after a proper bond has been given for the carrying out of the contract. If the bidder fails to furnish the bond as required by these specifications within ten days after the award is made, the said check shall be forfeited to the City.

Bond.

6. Bond in an amount equal to the contract price will be required upon the award of the contract conditioned for the faithful performance of each and every one of the terms of the contract to be performed by the contractor as herein specified, and the contractor by said bond shall indemnify and hold harmless the Mayor and City Council of Baltimore city against any and all claims, which may be made by reason of any infringement of patent rights in the use of lamps, dynamos or any other article, apparatus or process which may be used in operating or maintaining the lamps under these specifications; and said bond shall also indemnify and hold harmless the Mayor and City Council of Baltimore, its officers, agents or servants, and each and every one of them, against and from suits or actions of every name and description brought against the Mayor and City Council of Baltimore city, or any of its officers, agents or servants, and also from all damages and costs to which it, they or any of them may be put by reason of injury to the person or property of another, resulting from negligence, or carelessness in the performance of its obligations under this contract, or from any failure on the part of the contractor to comply with any or all of the conditions of these specifications.

Whenever the surety or sureties on the bond so furnished shall be deemed by the Mayor to be insufficient or unsatisfactory, the contractor, within ten days after notice to that effect, shall furnish and deliver a new bond to the Mayor and City Council of Baltimore, in the same penalty and on the same conditions, with surety satisfactory to the Mayor, and this duty shall continue on the part of the contractor, whenever and so often as the Mayor shall require a new bond with a satisfactory surety or sureties. If the contractor shall fail to furnish such bond within ten days after said notice mailed to his address, the Mayor and City Council of Baltimore, through its proper agent or agents, may stop all further work under said contract and relet the unfinished work at the expense of the contractor.

The contractor shall give his personal attention constantly to the faithful performance of the work, shall keep the same under his own control and shall not assign, by power of attorney or otherwise, nor sublet the work or any part thereof, without the previous written consent of the Superintendent of Lamps and Lighting. He shall state to the Superintendent of Lamps and Lighting, in writing, the name of such sub-contractor as he intends employing, the portion of the work which he is to do or the material which he is to furnish, his place of business and such other information as the Superintendent of Lamps and Lighting may require, in order to know whether such sub-contractor is reputable and reliable, and able to perform the work or to furnish the material as called for in the specifications.

He shall not, either legally or equitably, assign any of the moneys payable under the contract, or his claim thereto, unless by and with the like consent of the Superintendent of Lamps and Lighting.

Annulment of Contract.

7. If the contractor shall not well and truly observe, perform, fulfill and keep all and singular the covenants and conditions herein mentioned and contained, on his part and behalf to be observed, performed, fulfilled and kept, according to the true intent and meaning of these specifications, then in that case the Superintendent of Lamps and Lighting, with and by the advice and consent of the Mayor, may and shall have the power on the part of the City of Baltimore to declare this contract annulled and vacated, and thereupon it shall become and thenceforth be null and void.

Interpretation of Specifications.

8. As it is the true intent of these specifications to make provisions for obtaining and keeping in service at all times during the existence of this contract the very best and highest standard of electric arc and incandescent street lighting service as it is possible to secure, consistent with the recognized electric standards, it is distinctly understood that any doubt as to the meaning of these specifications and any obscurity in the wording of them will be clarified and interpreted by the Superintendent of Lamps and Lighting, who shall have the right to correct any ambiguity in them when such correction is necessary for the proper fulfillment of their intentions and the object desired, it being understood that no unreasonable construction will be placed upon these specifications different from their intentions, or that will in any manner operate as a burden to the contractor.

9. The Board of Awards reserves the right to reject any or all bids.

Territory to Be Lighted.

10. The territory to be lighted by the contractor under the requirements of these specifications shall be the City of Baltimore, and this territory shall be divided into two classes of districts, to be known as "Underground Districts" and "Overhead Districts," respectively.

Underground and Overhead Districts.

11. For the purpose of these specifications, the "Underground Districts" are defined as those streets, avenues, parks, squares, roads, bridges, docks, piers, lanes and alleys within the City of Baltimore, wherein the city has installed, or does from time to time during the term of this contract, construct systems of conduits, and where poles and overhead wires are eliminated or prohibited by proper order of the Electrical Commission. Lamp locations situated within three hundred (300) feet of the aforesaid underground districts and supplied by cable passing through said underground districts shall be considered to be within said underground districts. The overhead districts, for the purpose of these specifications, are defined as those portions of the City of Baltimore beyond or outside of the limits of the said underground districts and aforesaid lamp locations.

Underground Lamps and Regulations of Electrical Commission.

12. All arc and incandescent lamps located within these "Underground Districts" and such additional arc and incandescent lamps as may be ordered to be installed during the term of this contract shall be supplied by and through underground connections properly established by the contractor in the city conduits, under the supervision and in accordance with the rules, regulations and requirements of the Electrical Commission.

Overhead Lamps Changed to Underground at Contractor's Expense.

13. All arc and incandescent lamps located and in service within the overhead districts and all additional arc and incandescent lamps that may be ordered to be installed during the term of the contract shall be supplied by overhead wires. As the underground districts extend beyond their present boundaries, the contractor shall, at his own expense, except as to conduits, change from overhead to underground service in such extended underground districts, and all arc and incandescent lamps comprised in such change shall, after said change, be paid for by the city at the rate covered by the contract price for the maintenance of arc and incandescent lamps in the underground districts.

All Overhead Lamps to Be Changed to Underground Service as Conduit System Is Extended.

14. All arc and incandescent lamps located in the underground districts shall be served from circuits carried underground in the city conduits, and as said underground districts may be extended from time

to time during the term of this contract. All arc and incandescent lamps located along the line of such extensions of underground districts shall be changed from overhead to underground supply, in accordance with the provisions of these specifications, as soon as practicable after the conduit extensions have been made, and after receipt by the contractor of a proper order for the change. The lateral duct connections to the lamp poles for the proper distances will be made and owned by the City of Baltimore. The cable furnishing the electric service to each and every arc and incandescent lamp within the limits of the underground districts which shall be ready for service when this contract becomes effective, and thereafter furnished during the term of this contract, as said underground districts are from time to time extended, is to be owned and operated by the contractor, together with all appliances and devices necessary for the proper operation of the arc and incandescent lamps located in said underground districts. These specifications and the contract shall apply to and cover all arc lamps located in all the public parks and squares and all additional arc lamps that may be ordered to be installed in such parks and squares during the term of the contract, and is not to include the installation or maintenance of any incandescent lamps for any of the parks It is further conditioned that the contractor, upon the execution of a satisfactory contract, shall pay to the City of Baltimore duct rental at the rate or rates established by the Electrical Commission, in accordance with the lease executed by the contractor with the said Electrical Commission.

Equipment.

15. All labor, apparatus, wooden arc lamp posts (similar to a number of those now in service in the underground districts), mast arms, brackets, cables, wires, conductors, lamps, carbons, fixtures, fittings, connections, and appurtenances of every kind and every description, ordinarily necessary and suitable for the lighting of streets, etc., by electricity, under the requirements of these specifications, shall be furnished by and at the expense of the contractor, and also all electric current and labor of every description for supplying all arc lamps and incandescent lamps with electricity, and also maintenance and repairs of every kind. All construction, supplying of current, carbons, electrodes and globes of suitable quality and all labor necessary for lighting, extinguishing and keeping in repair and for all other purposes, shall be furnished at the expense of the contractor. All cables, wires and conductors of every description used for conveying and distributing the electric current

to all arc and incandescent lamps shall be properly and thoroughly insulated, and shall be placed in such locations and in such manner as will prevent them from being readily tampered with or handled by any unauthorized person or persons.

Type of Lamps.

16. Bids must be submitted on each of the types of arc and incandescent lamps described as follows:

Continuous Current Arc Lamps.

6.6 ampere constant current series enclosed arc type.

6.6 ampere constant current series luminous arc type.

6.6 ampere constant current series luminous arc type, where such lamps and posts are the property of or are purchased by or at the expense of the city.

4.0 ampere constant current series luminous arc type.

Continuous Current Enclosed Type.

Lamps of this type must operate at not less than six and six-tenths (6.6) amperes, and not less than seventy-two (72) volts, measured at the arc, or 75 volts when measured at the terminal or binding posts of the lamps.

Continuous Current Luminous Arc Type, 6.6 Amperes.

Lamps of this type must operate at not less than six and six-tenths (6.6) amperes, and not less than seventy-two (72) volts, measured at the arc, or 75 volts when measured at the terminal or binding posts of the lamps.

Continuous Current Luminous Arc Type, 4 Amperes.

Lamps of this type must operate at not less than four (4) amperes, and not less than seventy-two (72) volts, measured at the arc, or 75 volts when measured at the terminal or binding posts of the lamps.

The specified electric current and voltage for each arc and incandescent lamp must be maintained at each and every lamp in each and every circuit of such lamps. Any electric lamp other than those specified may be substituted at any time by the contractor for those specified, provided it is proved to be equal to the same in illuminating power and effect and in uniformity of operation.

Bids Must State Price for All-Night and Half-Night Service.

17. The bidder must state in his bid the price per arc and incandescent lamp per year for lamps burning *all* night and *every* night, and also for lamps burning for every *half* night during the year, for which he will furnish and light each of said lamps. The contractor must state also the price per arc and incandescent lamp per year including duct rental.

18. The incandescent lamps furnished under these specifications are to be of a standard and approved type, suspended from plain wood posts and plain lamp brackets or goose necks, except as specified in Section 27 of these specifications, and shall be of the best quality, with globe of clear glass of uniform thickness and proper shape to avoid causing rings or streaks of light and shadow. All arc and incandescent lamps that may become broken must be promptly replaced by sound ones, and all arc lamps used under these specifications shall burn with a steady light without undue hissing or flickering, each and every night during the term of this contract.

19. Should the contractor during the term of the contract be furnishing more than one type of arc lamp or incandescent lamp the contractor shall be permitted in the installation of additional lamps to use the one of these types which is suitable to be operated upon the circuit most favorably located or loaded as regards to the location of any additional lamp ordered by the Superintendent of Lamps and Lighting, except under conditions where proper street lighting makes it impossible to comply with this requirement.

Equipment Not to Be Dangerous or Unsightly.

20. Such equipment furnished under these specifications must not be dangerous, unsightly, or such as to incommode the adjoining property unnecessarily, and shall be erected in a manner satisfactory to the Superintendent of Lamps and Lighting.

Change of Lamp Locations and Discontinuance.

21. The transfer of arc and incandescent lamps must be made by the contractor within a reasonable time after the receipt of notice from the Superintendent of Lamps and Lighting, and the actual cost of labor employed in making these changes shall be paid to the contractor by the city. The Superintendent of Lamps and Lighting reserves the right at any time to discontinue the use of any arc or incandescent lamp or lamps that he may deem expedient; provided, however, that the

number of lamps specified as a minimum number to be furnished under these specifications shall not be diminished so long as the contract remains in force, and provided, further, that the total number of arc or incandescent lamps discontinued from service shall not exceed more than twenty-five arc lamps, nor more than twenty-five incandescent lamps in any one year, except in case of an extreme emergency. Lamps discontinued in one location may, however, be offset by lamps ordered at the same time in another location; the new locations being considered as transfers from the discontinued locations. This latter requirement, it is understood and agreed, does not apply to the twenty-five arc lamps and the twenty-five incandescent lamps which the city reserves the right to discontinue from the service, should conditions demand, nor does it apply to any arc lamps which may be discontinued from the service in the parks and squares by the Park Board.

Frosted Globes—Shading.

22. The Superintendent of Lamps and Lighting shall have the right to require the contractor to furnish ground globes or lamp shades for the purpose of shading such house or houses as may be deemed advisable in the judgment of the Superintendent of Lamps and Lighting, which the contractor shall furnish without additional cost.

Incandescent Lamp Renewals by Contractor.

23. Should any of the incandescent lamps furnished under the specifications become blackened, or otherwise reduced in candle power to an amount exceeding twenty per cent. (20%) of their initial candle power, same shall be promptly renewed by the contractor.

Clean Globes.

24. All inclosed arc lamp globes must be cleaned every fourth day. Each inclosed arc lamp shall be supplied with a clear glass, opal or opalescent glass, outer and inner globes, as may be directed by the Superintendent of Lamps and Lighting, and shall also be supplied with a clean glass outer globe.

Painting Lamp Posts.

25. All lamp posts, lamp supports and fixtures for the use of arc or incandescent lamps located in the underground district must be painted two coats of paint in such color as directed by the Superintendent of Lamps and Lighting, and such painting shall be done as

often as necessary to preserve a good appearance. All new lamp posts, lamp supports and fixtures for the use of any additional arc and incandescent lamps that may be ordered to be erected in said underground district may be painted two coats of paint in such color as directed by the Superintendent of Lamps and Lighting, and such painting shall be done as often as necessary to preserve a good appearance. Such painting shall be done at the expense of the contractor, except where applied to posts and fixtures owned or paid for by the city as special equipment.

Special Lamp Posts and Equipment.

26. Any and all special or ornamental lamp posts or other special equipment, including systems of piping and fittings to accommodate the contractors' cables and lamps for bridges and other structures or arc or incandescent lamps required by the Superintendent of Lamps and Lighting and approved by the contractor, shall be completely wired, erected and paid for and properly maintained, except as to lamp repairs and globe renewals, by the contractor and shall, after being paid for, remain the property of the City of Baltimore.

Adjustment of Lamp Equipment.

27. Whenever the Superintendent of Lamps and Lighting shall require that any lamp post or posts furnished by the contractor shall be straightened or set plumb, or that any lamp post or posts or other fixtures be painted or repaired, or that any arc or incandescent lamp be adjusted in such manner as will remove any shadows from the street beds so as to distribute the light to the best advantage in lighting the streets, the same shall be done as soon as practicable after the Superintendent of Lamps and Lighting shall notify the contractor of such requirement.

Removal of Lamps and Equipment.

28. The contractor shall remove any and all lamps, lamp posts, poles and fixtures used, erected and maintained by him exclusively for lighting under these specifications within ninety days after the expiration of this contract, should the Superintendent of Lamps and Lighting so require.

Testing.

29. For the purpose of making tests to determine whether or not the candle-power required by the terms of these specifications is being supplied by the arc and incandescent lamps and of examining apparatus and appliances, it is understood and agreed that the contractor will

furnish to and permit such person or persons as the Superintendent of Lamps and Lighting may authorize, access at all times to all lamps, lamp posts, poles, wires, conduits, fixtures, apparatus and machinery on the street or to any of the stations of the contractor supplying electric current or light under these specifications, and the said Superintendent of Lamps and Lighting shall have the privilege at any and all times when the arc and incandescent lamps are burning of testing any of the city electric light circuits at such point or points as may be selected by the Superintendent of Lamps and Lighting, by the use of such standard measuring instruments as he may desire to use, and any arc or incandescent lamp not found up to the standard of light, as provided by the specifications, will be considered as not burning, and the contractor shall be penalized as herein specified.

Service.

30. The term of this contract shall be from, and the service under this contract shall begin with September 13, 1913.

Number of Lamps at Beginning of Contract.

31. The minimum number of arc lamps, including those in the parks and squares, in service August 1, 1913, to be supplied under these specifications is twenty-nine hundred and seventy-five (2,975) of which number twelve hundred and eight (1,208) are now in the underground districts, and seventeen hundred and sixty-seven (1,767) are now in the overhead districts, including three hundred and eighty-five six and six-tenths (6.6) ampere luminous arc lamps owned by the city, and the contractor shall furnish all necessary equipment for supplying same, except as to poles and lamps ordered by the city as special equipment and except the poles and wires in Druid Hill Park, now the property of the city, but the use of such poles and wires will be granted to the contractor under these specifications without charge. Of the minimum number of lamps the contractor will be permitted to supply 1,308 six and six-tenths (6.6) ampere enclosed arcs and 1,667 four (4) ampere luminous arc lamps. The minimum number of incandescent lamps to be furnished under these specifications is eight hundred and forty-nine (849).

Daily Report of Outage.

32. When the city shall furnish, at its expense, suitable recording ammeters and blank charts therefor, the contractor will be required to supply a recording ammeter chart each morning, showing the perform-

ance of each machine or rectifier used on the circuits on the night previous. The contractor shall each day, before twelve o'clock noon, make a written report to the Superintendent of Lamps and Lighting, stating the number and location of any lamps extinguished or not burning on the preceding night, if any; the time when each lamp was reported extinguished or not burning, and the time the lamp was relighted and started burning; and the said report shall also state the cause for each said lamp being extinguished or failing to burn; and if any of the said lamps are extinguished by reason of the failure of the current to supply said lamps, or for any other reason, his report shall contain a statement of the cause of such failure to supply current.

Monthly Schedule of Lighting and Extinguishing Lamps.

33. On or before the last day of each month the Superintendent of Lamps and Lighting shall furnish to the contractor a schedule showing the time when the arc and incandescent lamps shall start to burn each night of the next ensuing month, and the time when the said arc and incandescent lamps shall be extinguished, which for lamps burning all night and every night during the year, shall be a half hour after sunset to half an hour to sunrise, respectively, in fair weather, and from sunset to sunrise when cloudy, and for lamps burning every half-night during the year, shall be from a half hour after sunset to midnight. The burning hours for each lamp under these specifications shall not exceed a total of four thousand (4,000) hours, annually, for lamps burning all night and every night, and two thousand (2,000) hours, annually, for lamps burning every half night during the year.

Voltage and Candle-Power.

34. The contractor is to maintain service at the current voltage and candle-power characteristics specified herein, subject to the provisions of Section Seventeen (17) herein, during the entire time provided in the said schedule, and all electric lamps shall burn at standard operating condition during the said time.

Contractor's Responsibility.

35. Any approval given by the Superintendent of Lamps and Lighting of any arc or incandescent lamps or equipment, provided under these specifications, or of any locations, shall not relieve the contractor of any responsibility in case of accident or injury to person or property.

Fines for Outages and Defective Service.

36. The contractor shall use due diligence in providing a regular uninterrupted supply of current during the time specified herein. Should the supply of current or the service under these specifications be interrupted or be defective, or fail as a result of the company's negligence, the Superintendent of Lamps and Lighting may deduct one night's pay for every arc or incandescent lamp not up to the standard provided herein, or for any arc or incandescent lamps upon a circuit not up to the standard, and two night's pay for every arc or incandescent lamp which the contractor shall fail to light during the entire night; provided that the Superintendent of Lamps and Lighting may, if the circumstances fairly warrant it, decide that a less reduction be made, and remit any part of the penalty imposed by this section, and should any arc or incandescent lamp or lamps be extinguished or not lighted during the time provided in the said schedule, through the fault or negligence of the contractor, and during the period of thirty minutes consecutively, the said Superintendent of Lamps and Lighting may deduct from the bills of the contractor half the amount which the contractor would be entitled to receive if such arc or incandescent lamp or lamps had been lighted during the whole night, and for each and every arc or incandescent lamp which shall be extinguished or not lighted for sixty minutes consecutively, the Superintendent of Lamps and Lighting may deduct the full amount which the contractor would be entitled to receive if such arc or incandescent lamp or lamps had been lighted the whole night, which deductions are hereby agreed upon, fixed and determined as liquidated damages which the contractor will suffer by reason of such lamps being extinguished or not lighted, or defective, as aforesaid, and not by way of penalty.

Any half-night lamp found to be out or not burning, or defective in any manner described hereinbefore, shall subject the contractor to half the amount of each fine stipulated in this paragraph for all night and every night lamp which may be found to be out or defective as set forth above.

Whenever and as often as any lamps supplied under these specifications shall cease or fail to burn, the contractor shall use due diligence to relight the same as soon as practicable and keep said lamps burning for the remainder of the night, even though under the terms of these specifications the contractor is to receive no pay for the said lamps for that night by reason of same having been out for one hour during the said night.

City to Light in an Emergency at Contractor's Expense.

37. Any failure on the part of the contractor to light the lamps, as required by the terms of these specifications, to such an extent as to require the city to provide any other, or a similar character of light, which may be necessary to meet the conditions that exist as a result of such failure to light the city streets, the additional expense of all such emergency lighting shall be charged to the contractor under this contract, and the contractor will be held solely responsible and liable for any damages for injury to any person or persons which may be due to the contractor's failure to light the streets as required by these specifications.

Defective Lamps to Be Changed.

38. Lamps not burning in a manner satisfactory to the Superintendent of Lamps and Lighting or his representatives shall be changed or adjusted, and proper lamps substituted within twelve hours after notice has been given by the Superintendent of Lamps and Lighting or his representatives that the lamps referred to do not burn satisfactorily or in accordance with the specifications.

39. No service whatever, other than that contracted for by the city and maintained on the city circuits, shall be supplied from the circuits giving current to the city lamps under these specifications, unless such service shall be approved in writing by the Superintendent of Lamps and Lighting.

System of Patrol Required.

40. The contractor must maintain, at his own expense, an efficient system of patrol for inspecting the arc and incandescent lamps during the hours of burning, so that any arc or incandescent lamp which fails to burn properly shall be promptly reported and put in order, or immediately replaced with a sound lamp. It is understood by the contractor that the utmost diligence shall be used in order that the streets, avenues, lanes, alleys, etc., shall be properly and efficiently lighted, and to this end a sufficient number of men shall be employed as inspectors by the contractor, so that each arc or incandescent lamp may be visited and examined at least three times each night.

The contractor will be required to arrange a schedule of passing points for his patrolmen in order that the inspectors of the lighting department can get in touch with them, when occasion requires, with the least possible delay.

Safety Appliances.

41. All safety appliances known to the best electrical practice shall be used throughout the system authorized directly or indirectly by this contract.

Circuit List of Lamps When Required.

42. The contractor shall furnish to the Superintendent of Lamps and Lighting, within five days of his request, the number and geographical location of each lamp on each circuit, and shall also specify the order in which the lamps are located on the circuit.

Payments.

43. It is further specified that on or before the fifth day of each and every month during the term of this contract the contractor shall make a statement to the satisfaction of the Superintendent of Lamps and Lighting that the said contractor has fully performed and fulfilled this contract in all particulars and conditions aforesaid during the preceding month.

The contractor will be paid by the city for the electric service supplied by said contractor at the contract price, on or before the fifteenth of each month, adjusted according to the number of street lamps in actual use.

Attention is called to Chapter 85 of the Acts of 1908.

NOTE—The contract for furnishing, operating and maintaining electric arc and incandescent lamps was awarded to the Consolidated Gas Electric Light and Power Company on October 1, 1913, for a term of one (1) year, beginning September 13, 1913.

Owing to a disagreement between the Gas and Electric Company and the City as to charges for material used in the transfer and alterations of electric lamps, this contract and bond has not as yet been executed. The matter of the differences existing is now under consideration by the Law Department, with a view of a satisfactory adjustment in favor of all concerned. In the meantime the city is paying for the service at the same prices specified in the Company's proposal, of which the following is an extract, and which prices are the same as prevailed under the old contract.

Ornamental luminous arc lamps (underground all-night service), each lamp per annum	$89 00
Ornamental luminous arc lamps (underground half-night service), each lamp per annum	81 00
Electric arc lamps (old type; underground all-night service), each lamp per annum	74 00
Electric arc lamp (old type; underground half-night service), each lamp per annum	68 00
Electric arc lamps (old type; overhead service), each lamp per annum	60 00
Incandescent electric lamps (40 candle-power; overhead all-night service), each lamp per annum	20 00
Incandescent electric lamps (40 candle-power; underground all-night service), each lamp per annum	36 00

SPECIFICATIONS

For Furnishing Incandescent Electric Current.

1. Bids will be received for furnishing incandescent electric current for use in the public buildings of every kind and description owned by the City of Baltimore, in which buildings such current is now being used and in all other public buildings in which electric current may be used in the future; also in squares, streets, avenues, alleys of the city, and in any other property of the city where the use of such current may become necessary.

2. Bids must be submitted in sealed envelopes, marked "Proposal for Furnishing Electric Current for Use in the Public Buildings Within the City of Baltimore and in Squares, Streets, Avenues and Alleys of the City," and addressed to the Board of Awards, in care of Richard Gwinn, City Register, City Hall, Baltimore, Maryland, not later than 11 o'clock A. M., Wednesday, September 3, 1913.

3. Bids must be submitted for a term of one, two, three and five years; service to each and every building and to the squares, streets, avenues, alleys of the city and in any other property of the city to begin as soon as practicable after the award of the contract.

4. The Board of Awards reserves the right to reject any and all bids.

Certified Check.

5. Each bidder must enclose with his bid his certified check for five hundred ($500) dollars on a clearing house bank, made payable to the order of the Mayor and City Council of Baltimore. The check of the successful bidder will be returned after the execution of the contract and after a proper bond has been given for the faithful performance of the contract. If the bidder fails to furnish the bond as required by these specifications within ten (10) days after the award is made, the said check shall be forfeited to the city.

Bond.

6. The successful bidder will be required to give bond in the amount of the contract price, conditioned that he shall comply in all respects with the terms and conditions of the contract, and his obligations thereunder, including the specifications, and shall indemnify and save harmless the Mayor and City Council of Baltimore against or from all costs, expense, damages, injury or loss to which the

said Mayor and City Council of Baltimore may be subjected by reason of any wrongdoing, misconduct, want of care or skill, negligence or default upon the part of the contractor, his agents or employees in or about the execution or performance of the contract, including said specifications, and shall save and keep harmless said Mayor and City Council of Baltimore against and from all claims or losses to it from any cause whatever, including patent infringements in the matter of furnishing said work and supplies.

Whenever the surety or sureties on the bond so furnished shall be deemed by the Mayor to be insufficient or unsatisfactory, the contractor, within ten days after notice to that effect, shall furnish and deliver a new bond to the Mayor and City Council of Baltimore, in the same penalty and on the same conditions, with surety satisfactory to the Mayor, and this duty shall continue on the part of the contractor whenever, and so often as, the Mayor shall require a new bond, with a satisfactory surety or sureties. If the contractor shall fail to furnish such bond within ten days after said notice mailed to his address, the Mayor and City Council of Baltimore, through its proper agent or agents, may stop all further work under said contract and relet the unfinished work at the expense of the contractor.

The contractor shall give his personal attention constantly to the faithful performance of the work, shall keep the same under his own control, and shall not assign, by power of attorney or otherwise, nor sublet the work or any part thereof, without the previous written consent of the Superintendent of Lamps and Lighting. He shall state to the Superintendent of Lamps and Lighting, in writing, the name of such sub-contractor as he intends employing, the portion of the work which he is to do or the material which he is to furnish, his place of business and such other information as the Superintendent of Lamps and Lighting may require, in order to know whether such sub-contractor is reputable and reliable and able to perform the work or to furnish the material as called for in the specifications.

He shall not, either legally or equitably, assign any of the moneys payable under the contract, or his claim thereto, unless by and with the like consent of the Superintendent of Lamps and Lighting.

7. Bidders must agree to supply incandescent electric current continuously for the twenty-four hours of each and every day during the term of the contract.

The city is to furnish and maintain all equipment from the point of connection by the contractor, which shall be the building line of any building or other structure in which electric current may be used.

except the meter or other device which may be installed for the benefit of the contractor.

8. In case of any instance wherein it may be or may become necessary for the contractor to install a transformer, frequency changer, rotary converter, motor generator or other translating apparatus in order to supply such incandescent electric current as may be required by the city, such device must be connected ahead of the meter, which is intended to measure the rectified current, and said meter is only to record the electric current used by the city after having been transformed or rectified.

9. The contractor must supply one meter for each installation, except in cases where more than one department occupies a building; then a meter must be connected to the wiring in each department, if it is so required.

10. Bids must be submitted for a price per kilowatt hour, with discounts, if any, for quantity consumed by meter measurement.

11. Bids must be submitted for current at a price per kilowatt hour, less free renewal of lamps.

12. Bidders must submit a price per kilowatt hour, based on a monthly lump consumption of approximately 65,000 kilowatt hours per month by the combined installations throughout the city.

(Signed) ROBERT J. McCUEN,
Superintendent of Lamps and Lighting

Approved:

(Signed) JAMES H. PRESTON,
President Board of Awards.

(Signed) S. S. FIELD,
City Solicitor.

The contract and bond for incandescent electric current is not yet executed. The matter is in the hands of the City Solicitor for adjustment, together with the contract for electric arc and incandescent lighting. The contract was awarded October 1, 1913. The prices, however, are the same as prevailed under the previous contract, and pending a settlement, the city is paying the same rates proposed by the Company, viz.:

Without Free Renewals of Lamps.

For the first twenty thousand (20,000) kilowatt hours per month, 5.66 cents per kilowatt hour.

For the next twenty thousand (20,000) kilowatt hours per month, 4.66 cents per kilowatt hour.

For all over forty thousand (40,000) kilowatt hours per month, 3.66 cents per kilowatt hour.

For a consumption of fifteen thousand (15,000) kilowatt hours or more in any one location, or for any one service, the consumption in such location being considered separately and not as in any way forming a part of the general consumption in other city buildings; that is to say, such consumption shall not be included in the total consumption of city buildings for the purpose of determining the rates to be paid for such total consumption, the price shall be:

Without free renewals of lamps, 3 cents per kilowatt hour.

NOTICE TO BIDDERS

BALTIMORE, August 13, 1913.

The City of Baltimore invites bids for mantle gas and naphtha street lighting fixtures and maintenance for such public streets, avenues, lanes, alleys, parks, squares and bridges as may, from time to time, be designated by the Superintendent of Lamps and Lighting during the term of the contract, from December 1, 1913, in accordance with the requirements contained in the attached specifications.

Bids are to be based on furnishing approximately 9,072 gas lamps and 300 naphtha lamps, in service on August 1, 1913.

The city will furnish the posts and the supply of gas for the gas lamps.

Bidders will be required to estimate for furnishing all the lamp fixtures, including the posts and lanterns and the supply of gasoline, necessary for operating the mantle naphtha lamps.

An alternate proposal for naphtha lamps, the city to furnish the posts.

Bidders will be required to include and estimate for the labor necessary to operate and maintain the mantle street lighting system.

Bidders will be required to submit two propositions, one for gas lighting and one for naphtha lighting, as set forth in Sections 1 and 2 of specifications, the two propositions going to make up one bid and to be awarded to one contractor. Bidders will also be required to sumbit a proposal for furnishing, operating and maintaining (per annum) mantle gas lamps in groups of two burners to be attached to one lamp post or standard.

Bids must be enclosed in sealed envelopes and marked, "Proposals for Gas and Naphtha Street Lamp Fixtures and Maintenance," and addressed to the Board of Awards, in care of Richard Gwinn, City Register, City Hall, Baltimore, Maryland, not later than 11 o'clock A. M., Wednesday, September 3, 1913.

A certified check of the bidder on a clearing house bank for two thousand dollars ($2,000), made payable to the order of the Mayor and City Council of Baltimore, must accompany each bid; said check to be forfeited to the city if, at the expiration of ten days after the award of the contract has been made, the contractor fails to execute said contract.

Bidders will be required to estimate for the labor necessary to operate the lamps and to keep the lamps in thorough repair.

Samples of the burners and the equipment to be furnished must be exhibited on the street at least three days prior to opening the bids.

The Board of Awards reserves the right to reject any or all bids.

(Signed) **ROBERT J. McCUEN**,.
Superintendent of Lamps and Lighting.

Approved August 20, 1913:

(Signed) **JAMES H. PRESTON**,
President Board of Awards.

(Signed) **S. S. FIELD**,
City Solicitor.

SPECIFICATIONS

For Incandescent Gas and Naphtha Lighting Equipment and Maintenance.

1. Proposals will be received for mantle gas lighting equipment, which will include the furnishing and maintaining by the contractor of entirely new incandescent mantle burners, mantles, automatic regulators, metal draught tubes (if necessary), and glass chimneys, lanterns and lamp heads, globes and all other necessary fixtures, parts, appliances and supplies used for incandescent street gas lighting, except lamp posts, as provided herein, which will be furnished by the city for all the gas lamps now in service in the public streets, avenues, lanes, alleys, parks and squares, and on the bridges within the City of Baltimore, and pro rata for such additional gas lamps as may be ordered to be installed by the Superintendent of Lamps and Lighting, and also to replace all broken or damaged glass street signs. All of said gas lamps' fixtures must be attached to all city lamp posts by the contractor, in a proper manner, so as to occupy an upright position in a vertical central line with the lantern so that the products of combustion will pass directly through the opening in the deflector plate on the "Miner" type of lamp or in the center of the crown of the "Boulevard" type of lantern, or through any other ornamental type or design of lantern that may be adopted by the Superintendent of Lamps and Lighting during the term of the contract. The city will pay for the necessary supply of gas, which will be furnished by the Gas Company under a separate contract with the city.

The contractor must estimate to keep all of said incandescent gas lamp fixtures in thorough repair, replace all broken and cracked globes and parts and all broken and defective mantles at all times when found necessary, during the term of the contract.

The mantle burners used during the term of this contract shall be thoroughly cleaned and kept free from all grease, dirt, filings and other obstructions. The gas mantle burners which are to be used in connection with this contract must be upright burners.

The contractor will be required to furnish at his own expense, all the labor that may be necessary to equip, repair, paint, clean, light and extinguish the mantle gas lamps.

2. Proposals will be received also in connection with the foregoing for the operating and maintaining of naphtha, or gasoline street lamps, using incandescent mantle burners, which will include the furnishing

by the contractor of iron lamp posts, lamps or lanterns (either globe type or square frame or other ornamental lantern), incandescent mantles, glass chimneys and draught tubes, globes, glass street signs and all necessary fixtures and appliances for operating these street lamps now in service within the City of Baltimore, and for all additional incandescent naphtha or gasoline street lamps, pro rata the contract price that may be ordered to be installed within the City of Baltimore by the Superintendent of Lamps and Lighting during the existence of this contract. . The contractor who may secure the award of this contract will be required to furnish all the gasoline or naphtha necessary to supply each such naphtha lamp each night during the term of the contract with a sufficient quantity of gasoline or naphtha to insure the standard of light (not less than 55 candle-power), required at all times during the hours of burning, which gasoline or naphtha must be of the very best grade and of a gravity of not less than seventy (70) degrees, free from water, gum, glue or other impurities. The contractor will be required to furnish at his own expense, all the labor that may be necessary to install, equip, repair, remove or transfer, paint, clean, light and extinguish these incandescent naphtha street lamps, and to perform any other work in connection with this character of street lighting.

Bidders must submit alternate proposals for naphtha lamps, posts to be furnished by the city.

3. Bids or estimates must be submitted according to the plans hereinafter specified, in sealed envelopes, marked "Proposals for Gas and Naphtha Street Lamp Fixtures and Maintenance," and addressed to the Board of Awards, in care of Richard Gwinn, City Register, at the City Hall, Baltimore, Maryland, not later than 11 o'clock A. M., Wednesday, September 3, 1913.

4. All bids must contain two propositions, namely: one for operating mantle gas lighting per lamp per year, as set forth in Section 1 herein, and one for mantle naphtha lighting per lamp per year, as set forth in Section 2 herein. The two propositions shall be considered together as going to make up one bid and not separately; the intent being to award the gas and naphtha street lighting contract to one contractor.

Bidders will be required to submit a proposal to furnish, operate and maintain (per annum) mantle gas lamps of two burners each; that is to say, two burners to be attached to one lamp post or standard and to be enclosed in one lantern or globe.

5. After the bids are opened by the Board of Awards, no bidder will be permitted to withdraw from the competition for this contract.

6. Bids or estimates must be submitted for the terms of one, two, three and five years.

Certified Check Must Accompany Each Bid.

7. Each bidder must enclose with his bid his certified check of two thousand ($2,000) dollars, made payable to the Mayor and City Council of Baltimore. The check of the successful bidder will not be returned to him until he has entered into a formal contract with the city and has given a satisfactory bond as a guarantee that the bidder will perform said contract according to the specifications and that he will properly perform the work required by the terms of these specifications. If the successful bidder fails to furnish the bond as required within ten days after the award of the contract has been made, the bidder's check shall be forfeited to the City of Baltimore.

Bond for Faithful Performance of Contract.

8. The successful bidder will be required to give bond in the amount of the contract price, conditioned that he shall comply in all respects with the terms and conditions of the contract, and his obligations thereunder, including the specifications, and shall indemnify and save harmless said Mayor and City Council of Baltimore, against or from all costs, expenses, damages, injury or loss, to which the said Mayor and City Council of Baltimore may be subjected by reason of any wrongdoing, misconduct, want of care or skill, negligence or default upon the part of the contractor, his agents or employees in or about the execution or performance of the contract, including said specifications, and shall save and keep harmless said Mayor and City Council of Baltimore against and from all claims or losses to it from any cause whatever, including patent infringements, in the matter of furnishing, operating and maintenance of gas and naphtha street lamp fixtures.

Whenever any material, process, composition or thing called for by these specifications is covered by letters patent, the successful bidder must secure, before using or employing such material, process, composition or thing, the assent, in writing, of the owner or licensee of such letters patent, and file the same with the Superintendent of Lamps and Lighting.

Whenever the surety or sureties on the bond so furnished shall be deemed by the Mayor to be insufficient or unsatisfactory, the contractor, within ten days after notice to that effect, shall furnish and deliver a new bond to the Mayor and City Council of Baltimore, in the same penalty and on the same conditions, with surety satisfactory to the Mayor, and this duty shall continue on the part of the contractor, whenever and so often as the Mayor shall require a new bond with a satisfactory surety or sureties. If the contractor shall fail to furnish such bond within ten days after said notice mailed to his address, the Mayor and City Council of Baltimore, through its proper agent or agents, may stop all further work under said contract and relet the unfinished work at the expense of the contractor.

The contractor shall give his personal attention constantly to the faithful performance of the work, shall keep the same under his own control and shall not assign, by power of attorney or otherwise, nor sublet the work or any part thereof, without the previous written consent of the Superintendent of Lamps and Lighting. He shall state to the Superintendent of Lamps and Lighting, in writing, the name of such sub-contractor as he intends employing, the portion of the work which he is to do or the material which he is to furnish, his place of business and such other information as the Superintendent of Lamps and Lighting may require, in order to know whether such sub-contractor is reputable and reliable, and able to perform the work or to furnish the material as called for in the specifications.

He shall not, either legally or equitably, assign any of the moneys payable under the contract, or his claim thereto, unless by and with the like consent of the Superintendent of Lamps and Lighting.

9. To prevent disputes and litigations, the Superintendent of Lamps and Lighting shall in all cases determine the amount, quality and acceptability of the work which is to be paid for under the contract; shall decide all questions in relation to said work and the performance thereof, and shall in all cases decide every question which may arise relative to the fulfillment of the contract on the part of the contractor. His determination, decision and estimate shall be final and conclusive, and in case any question shall arise between the parties touching the contract, such determination, decision and estimate shall be a condition precedent to the right of the contractor to receive any moneys under the contract.

Should any questions arise as to the true construction of this contract or the specifications hereto attached, said questions shall be submitted to the Superintendent of Lamps and Lighting, whose decision thereon shall be final, binding and conclusive on all the parties. This provision is in addition to, and not in substitution for, the preceding paragraph.

Non-Performance of Contract.

10. Notwithstanding the provisions of Paragraph 9 of these specifications, if the contractor shall not well and truly observe, perform, fill.

and keep all and singular the covenants and conditions hereinbefore and hereinafter mentioned and contained on its part to be observed and performed, fulfilled and kept according to the true intent and meaning of these specifications, then in case the Mayor may so determine, he may and shall have the power on the part of the City of Baltimore to declare this contract annulled and vacated, and thereupon it shall become and be thenceforth null and void.

Date When This Contract Shall Commence.

11. The present contract for the gas and naphtha lamp equipment, maintenance and operation, will expire November 30, 1913, and the contract awarded under these specifications for such fixtures and service shall begin December 1, 1913. All street lamps on the city streets, alleys and bridges and in the city parks and squares must be equipped in as reasonable time after the first day of December, 1913, as practicable, not to exceed thirty (30) days thereafter.

Contractor Must Perform All Work Promptly.

12. Should the contractor fail to commence the work of equipping the gas and naphtha street lamps at or during the time specified or to operate, maintain, repair, paint, clean and fit up the lamps or to install new lamps or to do any work as specified hereinbefore or hereinafter, after due notice has been given, the Superintendent of Lamps and Lighting may and shall have the power to cause such work to be performed by other parties and to deduct the expenses thereof from any moneys which may be due or may become due the contractor and to hold the contractor and his sureties liable for the amount thereof which may be in excess of the price stipulated in this contract.

Assignment of Contract—Experience.

13. Any assignment of this contract or sub-letting of the work to be done under said contract shall be subject to the consent of the Superintendent of Lamps and Lighting and shall not otherwise be done.

Bidders must present satisfactory evidence that they have been regularly engaged in the business of incandescent gas and naphtha mantle street lighting, and that they are fully prepared with the necessary capital, material and appliances to conduct the work covered by their contract, to the satisfaction of the Superintendent of Lamps and Lighting, and to begin the said contract within the time limit mentioned in Section 11 of these specifications.

Rights of the Board of Awards.

14. The Board of Awards reserves the right to reject any or all bids.

Equipment, Its Adjustment During the Term of Contract and Its Disposal at the Expiration of the Contract.

15. The contractor will be required to furnish incandescent mantle burners and all other lamp fixtures specified in "Sections 1 and 2" of these specifications, and also to furnish the lamps and lanterns for all additional lamps for the streets, alleys, parks, squares and bridges that may be ordered to be installed by the Superintendent of Lamps and Lighting during the term of this contract, as well as any ornamental lamps, lanterns or globes, and fixtures that may be ordered from time to time; globes to be subject to the approval of the Superintendent of Lamps and Lighting; all lanterns and globes, burners and other necessary lamp fixtures furnished by the contractor and used by him in the operation of this contract shall remain the property of the said contractor, but the City of Baltimore reserves the right to purchase the lamp fixtures, or any part thereof, except burners, at any time before or at the expiration of this contract, at the actual value at that time. At the completion of this contract all lamp fixtures owned by the contractor shall be removed by him, except such lamp fixtures, lamps, lanterns or globes that may be owned or purchased by the city, and the street lamps must be restored to the same condition in which the contractor found them at the beginning of the contract, without cost to the City of Baltimore, and the value of the lamp equipment at any time before or at the expiration of this contract, should the city decide to purchase the same, shall be determined by the contractor, the Superintendent of Lamps and Lighting and by a third person, who shall be selected by the said contractor and the Superintendent of Lamps and Lighting, or by the Mayor, in case of their failure to select such third person within thirty days. The city reserves the right to purchase the globes and fixtures at the expiration of the contract.

All Lamp Fixtures Must Be Latest Improved Pattern.

16. As it is the intention of the Superintendent of Lamps and Lighting to gradually discontinue the use of all the old "Miner" lanterns, on account of these lanterns having become unserviceable, owing to their twenty years' service, the successful contractor will be required to furnish "Boulevard" lanterns and globes, or any other artistic design of lanterns or lamp heads with iron lamp extensions, acceptable to the Superintendent of Lamps and Lighting, which "Boulevard"

lanterns or other artistic design of lanterns are to take the place during the term of the contract of said "Miner" lanterns now in use. Therefore, each bidder must be governed accordingly in the preparation of his bid or estimate.

The successful contractor will be required to paint letters forming the names of streets on such ornamental or artistic lantern globes which may be adopted and on which it may be impossible to properly place the usual glass street signs. The size and color of the lettering must be subject to the approval of the Superintendent of Lamps and Lighting.

All burners, mantles, globes, appliances and fixtures furnished under this contract shall be of the latest improved pattern. Should it be found that any modern invention, improvement, alteration or change of any kind in lamp fixtures shall have been made or discovered during the progress of this contract whereby the light-giving power of the lamps furnished under this contract may be increased or the ornamentation of the lamp equipment furnished under this contract may be improved, thereby adding to the efficiency of the service, then, in that case, the city, through the Superintendent of Lamps and Lighting, shall have the power to order such inventions, improvements, changes or alterations, and any reasonable cost in addition to the existing contract price shall be paid to the contractor, upon the approval of the Board of Awards.

Lamp Burners—"Pilot" or "By-Pass."

17. Should the contractor who may receive the award of this contract desire to use incandescent mantle burners with "Pilot" or "By-Pass" attachment by which the gas is burned during the day or continuously, then, in that case, it is distinctly understood that the contractor must be responsible and shall pay for the quantity of gas it shall be determined has been burned each month by the contractor for the use of such burners and attachments each day. The quantity of gas consumed by the "Pilot" light will be ascertained by the Superintendent of Lamps and Lighting by connecting a series of six lamps with one meter and the average consumption thus obtained shall form a basis for determining the quantity of gas consumed by all such "Pilot" or "By-Pass" burners during the day time or continuously, and each lamp having the "Pilot" light shall be adjusted to such a height that it will not be extinguished through the diminution of pressure or blown out when fixed in the lantern for street service and the total amount of gas so consumed by the "Pilot" or "By-Pass," on all the street lamps must be paid for by the contractor.

In case "Pilot" or "By-Pass" burners are used the contractor will be required to place them on all gas lamps in each lamp-lighter's district, including the three meter lamps. Should the contractor fail to equip all street gas lamps in each lamp-lighter's district, including the three meter lamps, with such burners, after notice from the Superintendent of Lamps and Lighting, a fine at the rate of twenty-five cents each lamp each night will be imposed upon the contractor for every lamp not so equipped.

The contractor will be required to adjust each "Pilot" burner on each street gas lamp so as to burn as nearly as possible the same amount of gas on each lamp.

Care of Lamp Burners.

18. Each incandescent mantle gas burner must be kept clear at all time so as to allow a free and unobstructed flow of gas and must be adjusted and regulated by the use of automatic regulators and governors so as to produce a light equal in power to not less than fifty-five (55) candles, under varying pressure of gas above two inches during the hours of burning. The means used to regulate the supply of gas, the shutters used to regulate the supply of air, the tubes and all other attachments of the burners must be kept free from rust and corrosion so as to permit of being easily adjusted or regulated when found necessary to increase or diminish the consumption of the gas and the supply of air, as conditions may demand from time to time, to insure a perfect bunsen and to maintain the standard of light required at all times during each night.

Incandescent mantle naphtha burners must be properly regulated and kept clean so as to insure a light equal to not less than fifty-five (55) candle-power at all times during the hours of burning.

Incandescent Mantles.

19. All incandescent mantles to be used with an upright burner in the operation of this contract must be such as are best suited to the burners adopted. No incandescent mantle will be permitted to be used unless composed of the best material and standard weave not less than 2¾ inches in length, and of first-class quality in all respects. No incandescent mantle shall be allowed to be used by the contractor which will shrink beyond reasonable dimensions from its original size, and all broken, smoked or blackened, ragged or frayed mantles must be removed at once and must be replaced by new mantles by the contractor. A fine at the rate of double the contract price per lamp per night shall be imposed on the contractor each night for every lamp which contains a short mantle, or a mantle less than the specified size.

Wire Gauze Burner Heads.

20. The wire gauze heads shall be kept perfectly clean and shall be replaced with new ones whenever the wire gauzes shall become corroded from weather or other conditions or when destroyed by the action of the heat.

Lamp Chimneys and Draught Tubes.

21. The contractor will be required to equip all street lamps now in service and such additional street lamps that may be placed in service during the term of this contract with metal draught tubes and glass chimneys of the very best quality. The metal draught tubes shall be placed directly over the burner and mantle, the lower point of the tube to reach the top of each mantle, and the glass chimneys shall be placed around the burner and mantle.

Lamp Globes and Street Signs.

22. The lamp globes and lantern glass must be of good quality lead glass, free from all defects whatsoever and the contractor will be required to fit the globes and lantern glass properly at the bottom and top of the gas and naphtha lamp frames so that the burner and mantle will not be affected by the action of the wind or by bugs and insects, to the extent of reducing the standard of light required. All globes, domes, lantern glass, lamps and street signs are to be kept in a perfectly clean condition so that the light of the lamps will be absorbed or obstructed as little as possible. The globes, domes, lantern glass and street signs are to be cleaned at least twice each week and oftener if directed by the Superintendent of Lamps and Lighting. A failure on the part of the contractor to clean dirty or soiled globes, chimneys and domes, or to replace broken globes, broken, misplaced or missing street signs in a reasonable time *after his attention has been called to such conditions by the Superintendent of Lamps and Lighting*, will subject said contractor to a fine of twenty-five cents in each case, each time such failure occurs.

Candle Power Required and Tests to Be Made.

23. The contractor will be required to maintain in each street lamp with the use of an incandescent mantle burner and fixture, a standard of light equal in power to not less than fifty-five (55) candles at all times during the hours of burning. A candle power shall be the intensity of light produced by the Standard sperm candle, consuming not less than one hundred and twenty (120) grains of wax per hour.

The tests made in the laboratory, should it be decided to test by such method, shall be either by the standard candle system or by the "Harcourt Pentane Standard."

For the purpose of ascertaining whether or not the candle power required is being maintained at the proper standard the Superintendent of Lamps and Lighting shall have the right at all times to order photometric or other tests of the lamp burners and mantles, to be made in such manner as he may determine, both at the laboratory of the Department and in position as the lamps appear when in service on the streets, parks, squares and bridges, at which the contractor or his representative may be present.

When the test of the lamp burners and mantles, which shall be removed from the street lamps, are to be made at the laboratory, or elsewhere, the contractor will be notified so as to enable him to furnish burners and mantles to replace those removed for testing purposes. If the lamp burners and mantles so tested show a light less than fifty-five (55) candle power and the cause is found to be due to defective burners or mantles, or to a faulty equipment of any kind, or to any neglect of the contractor to regulate the burners and mantles properly, then in that case, a fine of fifty cents shall be imposed upon the contractor for every one of such defective lamp burners and mantles, which fine shall be deducted from any moneys which may be due the contractor by the city.

The tests shall be made as often as may be deemed necessary by the Superintendent of Lamps and Lighting.

Trial Tests.

24. Each bidder will be required to furnish for exhibition the lamp fixtures and equipment such as are proposed by him to be used in connection with this contract, and to place the fixture on the lamp posts at such points on such streets as may be designated by the Superintendent of Lamps and Lighting, at least three (3) days *prior* to the opening of the bids.

The Superintendent of Lamps and Lighting shall have the right to test for the purpose of ascertaining the light-giving power and the general efficiency, all burners and mantles which which may be submitted, before the award of the contract is made, which test shall be made in such manner and at such place or places, as may be determined upon by the Superintendent of Lamps and Lighting. Any gas burner which shall fail under such test to produce a light equal in power to fifty-five (55) candles on a consumption of three (3) cubic feet of gas per hour, and any naphtha burner which shall fail to produce fifty-five (55) candle power shall be rejected and the bidder who may own such burner or burners shall be disqualified.

Consumption of Gas.

25. The contractor shall equip each street gas lamp with an incandescent mantle, burner and fixtures so combined and adjusted as to secure under all ordinary variations of gas pressure, a light equal in power to not less than fifty-five (55) candles, on a consumption of three (3) cubic feet of gas per hour, and the contractor will be required to pay for any quantity of gas burned in excess of three (3) cubic feet of gas per hour, and any amount shown by the meter lamps as properly chargeable against the contractor shall be deducted by the Superintendent of Lamps and Lighting from his monthly payments.

Time for Lighting and Extinguishing Street Lamps

26. All gas and naphtha street lamps within the City of Baltimore must be lighted and extinguished *one hour after* the time designated to begin to light each evening and to extinguish each morning said street lamps, and the contractor must agree to comply strictly with this requirement by employing a sufficient force of lamp lighters to insure the gas and naphtha lamps being so lighted and extinguished.

If the contractor fails, for any reason, to light the lamps in the evening or extinguish said lamps in the morning, in accordance with the *daily* schedule of lighting and extinguishing issued by the Superintendent of Lamps and Lighting, to the inconvenience or injury of any person or persons using the public streets during the evening or the morning, the said contractor will be held solely responsible and will be liable for any damage that may be sustained by any such person or persons who may be inconvenienced or injured as a result of such failure to light and extinguish the lamps as hereby required.

The street lamps must be lighted and extinguished strictly in accordance with the official schedules, or time tables, issued and furnished by the Superintendent of Lamps and Lighting, which schedule or time table shall aggregate four thousand (4,000) burning hours per lamp per annum.

All street lamps must be lighted and extinguished one hour after the time specified to begin to light and extinguish. No street lamps shall be lighted or extinguished before the time specified to begin to light and extinguish.

In order that the Superintendent of Lamps and Lighting and his assistants may determine whether the lamps are lighted and extinguished in accordance with the official schedule or time table, hereinbefore mentioned, the contractor shall furnish the Superintendent of Lamps and Lighting with maps or lists showing the number and geographical location of each lamp in each lamp-lighter's district, and shall designate the particular lamp at which the lamp lighter commences to light, also the central lamp and the lamp at which each lamp lighter completes the lighting and extinguishing the lamps. The lamp lighter shall begin and finish at the same lamps as are designated for beginning, centre and finishing the lighting, and the contractor shall notify the Superintendent of Lamps and Lighting of any change which may be made in the beginning, centre and finishing points on any lamp district during the term of this contract. A fine at the rate of double the amount of the contract price per lamp per night will be imposed on the contractor each night for every lamp not lighted within the hour from the time of beginning to light, and a fine in the same amount shall be imposed on every lamp found lighted before the hour designated to begin to light. The same penalty will be imposed for every lamp found extinguished before the time specified to begin to extinguish.

Arrangement of Lamp Lighter's District and the Order of Lighting and Extinguishing Meter Lamps.

27. Each lamp lighter's district throughout the city which may entirely consist of gas lamps, shall be arranged so as to include not less than three (3) meter lamps at substantially the beginning, centre, and end of each lamp-lighter's district. Should it be found necessary to rearrange any lamp lighter's district, the Superintendent of Lamps and Lighting must be notified of such rearrangement or change by the contractor, and thereupon, the city will bear the expense of removing the meter lamps to the new location necessary to maintain the positions above mentioned, and these meter lamps must be lighted and extinguished in the regular order in which they are arranged. The contractor will be required to regulate all meter lamp burners so that these lamps will at all times maintain the standard of light equal to that of the non-metered lamps. A fine of twenty-five cents will be imposed upon the contractor for every meter lamp which is found to be a dim light, or producing a less volume of light than is shown by non-metered lamps, which fine shall be deducted from the contractor's monthly payments.

Daily Reports.

28. The contractor shall daily, before 12 o'clock noon, submit a written report to the Superintendent of Lamps and Lighting, stating the number of lamps, and their location, which were not burning or defective during the preceding night, if any, and the cause thereof.

Penalty for Defective Street Lighting.

29. Any lamp that fails to burn continuously during the hours scheduled, or any lamp found to be defective in any manner, causing such lamp to fall below the standard of light required, shall subject the contractor to a fine at the rate of double the amount of the contract price per lamp, per night, and all such fines shall be deducted each month from any money due the contractor by the city. Defective lights, which may result from any cause or condition over which the contractor or his agents or employees shall have no control, shall not be subject to a fine, but such conditions shall be determined by the Superintendent of Lamps and Lighting.

Repairs of Street Lamps to be Made by the Contractor.

30. The contractor shall, without extra pay, replace all wrecked, broken or damaged lamp posts with new ones, repair all lamp posts, lanterns and lamps, straighten all leaning lamp posts, replace broken globes and broken or missing street signs with new ones, relay all sidewalks and replace the surface disturbed in erecting or moving street lamps, keep all lanterns, globes and sign frames in proper position, place all street signs so that all the letters forming the name of the street can be seen at all times, so that the lanterns or lamps and lamp posts will at all times present to the public a neat and attractive appearance, and in general maintain the street lighting plant in first-class condition. The repairs will include painting the lamp posts and lanterns once during the year. Painting will be done in a good and workmanlike manner, with paint of a color and quality to be determined by the Superintendent of Lamps and Lighting. The contractor will keep such of the city property that may be used in the operation of this contract in thorough repair, and shall deliver the same to the city at the expiration of the term of the contract in good order and condition. The work and repairs enumerated in this section must be done by the contractor in as reasonable time after the order has been given by the Superintendent of Lamps and Lighting as possible.

If the contractor shall fail to perform the work, repairs and maintenance as specified in this section within ten days after being notified by the Superintendent of Lamps and Lighting, then the work set forth herein will be done by the City of Baltimore, under the supervision of the Superintendent of Lamps and Lighting, and the cost of the work shall be deducted from any moneys that may be due the contractor by the city.

Wrecked Street Lamps.

31. The contractor will be required to re-erect all street lamps and lamp posts that may be wrecked or broken down by runaway teams or through any other kind of accident or cause, and all the lamp fixtures including the lamp posts and the labor necessary in erecting the new lamp and post in place of the wrecked or broken lamp and post must be furnished the city by the contractor at his own expense. Such posts, lamps and fixtures will become the property of the city.

The contractor shall be allowed to collect the actual amount of the expense involved from the person or persons who may have wrecked or broken any street lamps, or whose agents, employees or servants may have wrecked or broken any street gas or naphtha lamp.

Discontinued Gas and Naphtha Lamps.

32. The Superintendent of Lamps and Lighting reserves the right to discontinue from service any number of gas lamps during the term of this contract, as conditions may require, provided the total number be not reduced below 8,000 street gas lamps, also to discontinue the service of such number of gasoline or naphtha lamps as conditions for the good of the street lighting service may demand, provided the number be not reduced below 100.

Number of Lamps in Service—Equipment Owned By the City and By Contractor.

33. There are in the service, August 1, 1913, 9,073 gas lamps, and 343 gasoline or naphtha lamps.

The city owns all gas lamp posts, including 199 artistic posts and lanterns, 1,205 "Boulevard" lanterns and globes, 5,511 "Miner" lanterns and globes to be replaced by "Boulevard" lantern or other artistic design, acceptable to the Superintendent of Lamps and Lighting.

The contractor owns 343 gasoline or naphtha lamp posts and lanterns, 1,605 "Boulevard" lanterns and 470 artistic opalescent globes with ventilators and lamp post extensions for the use of these artistic globes.

Each bidder, therefore, must be governed according to the above information in the preparation of his bid or estimate.

Labor to Be Employed.

34. The contractor shall give preference in employment, first to the citizens of the City of Baltimore, second to the citizens of the State of Maryland, and no workman, laborer or mechanic shall be required to labor more than eight hours in one calendar day.

And it is distinctly understood and agreed that under no circumstances shall minors be employed in connection with the work of this contract, nor shall minors be permitted to assist any workmen having charge of any part of the work of this contract, see also Chapter 85 of the Acts of 1908, and Chapter 94 of the Acts of 1910.

Any violation of the requirements of this section will work a forfeiture of this contract.

35. The successful bidder will be required to place a lamp shade on street lamps, whenever application is made for such by any person who may desire the use of such shade, without cost, either to the applicant or the city. The lamp shade may consist of a frosted inner globe, or a piece of frosted glass securely fastened to the lantern, so as to prevent shifting, or it may be a spot of white paint, about four (4) inches in diameter, painted on the outside of the lamp globe next to the house to be shaded.

No dark shade of any kind, which may darken the sidewalk or the bed of the street, will be permitted under any circumstances.

36. The contractor will be paid by the city for the gas and naphtha street lighting service supplied by said contractor at the contract price, on or before the fifteenth of each month, adjusted according to the number of street lamps in actual use.

(Signed) **Robert J. McCuen,**
Superintendent of Lamps and Lighting.

BID.

BALTIMORE, MD., September 3, 1913.

Honorable Board of Awards,

City of Baltimore, Baltimore, Md.

GENTLEMEN—In answer to your advertisement, and in strict compliance with the specifications, a copy of which is attached and made a part hereof, we hereby propose, and if awarded the contract, will furnish, install and maintain incandescent gas and gasoline lamps on the streets, avenues, lanes, parks, squares and bridges in the City of Baltimore, in accordance with the various plans suggested by the said specifications, at and for the following prices, to wit:

BOULEVARD OR MINER GAS LAMPS.

(One burner in each lamp.)

One year—Nine dollars and eighty cents ($9.80) per lamp per annum.
Two years—Nine dollars and sixty cents ($9.60) per lamp per annum.
Three years—Nine dollars and forty cents ($9.40) per lamp per annum.
Five years—Nine dollars ($9.00) per lamp per annum.

AESTHETIC OR ARTISTIC GAS LAMPS.

(One burner in each lamp.)

One year—Nine dollars and eighty cents ($9.80) per lamp per annum.
Two years—Nine dollars and sixty cents ($9.60) per lamp per annum.
Three years—Nine dollars and forty cents ($9.40) per lamp per annum.
Five years—Nine dollars ($9.00) per lamp per annum.

BOULEVARD, MINER OR ARTISTIC GAS LAMPS.

(Two burners in each lamp.)

One year—Thirteen dollars and sixty cents ($13.60) per lamp per annum.

Two years—Thirteen dollars and forty cents ($13.40) per lamp per annum.

Three years—Thirteen dollars and twenty cents ($13.20) per lamp per annum.

Five years—Thirteen dollars ($13.00) per lamp per annum.

Gasoline Incandescent Lamps.

(One burner in each lamp.)

One year—Twenty-seven dollars ($27.00) per lamp per annum.
Two years—Twenty-seven dollars ($27.00) per lamp per annum.
Three years—Twenty-seven dollars ($27.00) per lamp per annum.
Five years—Twenty-seven dollars ($27.00) per lamp per annum.

Gasoline Incandescent Lamps.

(One burner in each lamp—city to furnish posts.)

One year—Twenty-seven dollars ($27.00) per lamp per annum.
Two years—Twenty-seven dollars ($27.00) per lamp per annum.
Three years—Twenty-seven dollars ($27.00) per lamp per annum.
Five years—Twenty-seven dollars ($27.00) per lamp per annum.

We herewith enclose our certified check on the National Bank of Baltimore, in the amount of two thousand ($2,000) dollars; also letter from the National Surety Company of New York, same being to the effect that they will furnish bond in the amount of one hundred thousand ($100,000) dollars if the contract is awarded to us.

Trusting we will receive a renewal of our present contract and that the pleasant relations existing between the city and our company will continue, we beg to remain,

Yours very respectfully,

American Street Lighting Company,

(Signed) E. S. Newbold,
President.

Attest:
Charles D. Nicolai,
Secretary.

CONTRACT.

This Contract, Made the twenty-fifth day of September, in the year 1913, by and between The American Street Lighting Company, of Delaware, a private corporation, hereinafter called the Lighting Company, and the Mayor and City Council of Baltimore, a municipal corporation, hereinafter called the City.

Whereas, The contract for lighting the streets, avenues, lanes, alleys, squares, parks and bridges in Baltimore city for a period of three years, accounting from the first day of December, in the year 1913, in accordance with Paragraphs 1 and 2 of the specifications for incandescent gas and naphtha lighting equipment and maintenance, a copy of which is hereto attached and in all respects made a part hereof and subject to all conditions, covenants, stipulations, terms and provisions contained in said specifications, has recently been awarded to the Lighting Company by the City, through the agency of its Board of Awards, at and for the sum of nine dollars and forty cents ($9.40) per lamp per annum for the gas lamps, and at and for the sum of twenty-seven dollars ($27) per lamp per annum for the naphtha lamps having one burner in each lantern; and

Whereas, It was one of the conditions of said award that a formal contract should be executed by and between the Lighting Company and the City, evidencing the terms of said award.

Now, therefore, This contract witnesseth, That the Lighting Company doth hereby covenant and agree with the City that it will well and faithfully light the streets, avenues, lanes, alleys, squares, parks and bridges in Baltimore city, as the same are set forth in said specifications and in accordance with each and every one of the conditions, covenants, stipulations, terms and provisions contained in said specifications, at and for the respective rates of compensation per lamp per annum hereinbefore mentioned for the period of three years, accounting from the first day of December, in the year 1913, and that it will well and faithfully comply with and perform each and every obligation imposed upon it by said specifications or the terms of said award.

And, The City doth hereby covenant and agree with the Lighting Company, that it will pay to the Lighting Company the respective rates of compensation per lamp per annum hereinbefore mentioned in monthly installments, adjusted with reference to the number of lamps in actual use during the several months of said period of three years, accounting from the first day of December, in the year 1913, and that it will well and faithfully comply with and perform, each and every obligation imposed upon it by said specifications, or the terms of said award.

IN WITNESS WHEREOF, The Lighting Company has caused these presents to be signed by its President, and its corporate seal to be hereunto affixed, duly attested by its Secretary, and the City has caused these presents to be signed by the Mayor of Baltimore City, and the corporate seal of the City to be hereunto affixed, duly attested by the City Register.

THE AMERICAN STREET LIGHTING COMPANY,

Superintendent of Lamps and Lighting.

BOND.

Know all men by these presents, That we, the American Street Lighting Company, a corporation created under the laws of the State of Delaware, with its principal place of business in the City of Baltimore, Maryland, as Principal, and the United States Fidelity and Guaranty Company, a corporation created and existing under the laws of the State of Maryland, with its principal office in the City of Baltimore, Maryland, and the National Surety Company, a corporation created and existing under the laws of the State of New York, with its principal office in the City of New York, New York, as sureties, are held and firmly bound unto The Mayor and City Council of Baltimore, in the full and just sum of one hundred thousand ($100,000) dollars) lawful money of the United States, to be paid to the said Mayor and City Council of Baltimore, or their certain attorneys, to which payment well and truly to be made and done we bind ourselves, our successors and assigns, jointly and severally, firmly by these presents.

Whereas, The above bounden American Street Lighting Company has entered into a contract with the said Mayor and City Council of Baltimore, bearing even date herewith, for lighting the streets, lanes, alleys, squares, parks and bridges in Baltimore City for a period of three years, accounting from the first day of December, in the year 1913, upon certain terms and conditions, in said contract more particularly mentioned; and

Whereas, It was one of the conditions of the award of the Board of Awards of said Mayor and City Council of Baltimore, pursuant to which said contract was entered into, that these presents should be executed.

Now, therefore, The condition of this obligation is such, that if the above bounden American Street Lighting Company shall, in all respects comply with the terms and conditions of said contract and its obligations thereunder, including the specifications therein referred to, and made a part hereof, and shall indemnify and save harmless the said Mayor and City Council of Baltimore against and from all costs, expenses, damages, injury, or loss to which the said Mayor and City Council of Baltimore may be subjected by reason of any wrong-doing, misconduct, want of care or skill, negligence, or default, upon the part of the said American Street Lighting Company, its agents or employees in or about the execution or performance of said contract, including said specifications, and shall save and keep harmless the said Mayor and City Council of Baltimore against and from all claims or losses to it from any cause whatsoever, including patent infringements in the matter of furnishing and maintenance of gas and naphtha street lighting and fixtures, then this obligation to be void; otherwise to be and remain in full force and virtue in law.

IN TESTIMONY WHEREOF, The said American Street Lighting Company has caused these presents to be sealed with its corporate seal, attested by the signature of its duly authorized officers, and the said United States Fidelity and Guaranty Company has caused these presents to be sealed with its corporate seal, duly attested by its authorized officers, and the said National Surety Company has caused these presents to be sealed with its corporate seal, duly attested by its authorized officers, this twenty-fifth day of September, A. D. 1913.

AMERICAN STREET LIGHTING COMPANY,

SPECIFICATIONS

For Furnishing Illuminating Gas for All Gas Lamps Used by the City in Lighting the Streets, Avenues, Lanes, Bridges, Public Parks, Squares and Places, and for Use in Lighting the Public Buildings Within the City of Baltimore.

1. Bids will be received for furnishing illuminating gas for all the street and outdoor lamps operated by the city under the incandescent mantle system which are now in service, and which may hereafter be placed in service, and for lighting all the public buildings within the city of Baltimore, under the following conditions:

2. Bids must be submitted in sealed envelopes marked "Proposals for Furnishing Illuminating Gas for Street Lamps, and for Use in All Municipal Buildings and Other Places Within the City of Baltimore," and addressed to the Board of Awards, in care of the City Register, at City Hall, Baltimore, Md., not later than 11 o'clock A. M., Wednesday, March 5, 1913.

3. Bids must be submitted for terms of one, two, three and five years, beginning March 1, 1913.

Certified Check.

4. Each bidder must enclose with his bid his certified check on a clearing-house bank for five hundred ($500) dollars, made payable to the order of the Mayor and City Council of Baltimore. The check of the successful bidder will be returned after the execution of the contract and after a proper bond has been given for the faithful performance of the contract. If the bidder fails to furnish the bond as required by these specifications within ten (10) days after the award is made, the said check shall be forfeited to the city.

Bond for Faithful Performance of Contract.

5. Bond in the amount of the contract price will be required upon the award of the contract conditioned for the faithful performance of each and every one of the terms of the contract to be performed by the contractor as herein specified, and the contractor by said bond shall indemnify and hold harmless the Mayor and City Council of Baltimore city, its officers, agents and servants, each and every one of them,

against and from all suits and actions of every name and description brought against the Mayor and City Council of Baltimore city, or any of its officers, agents or servants, arising out of the execution and performance by it of said contract and also from all damages and costs to which it, they or any of them may be put by reason of injury to the person or property of another, resulting from negligence or carelessness in the performance of the contractor's obligations under this contract or from any accident of any kind caused by an explosion of gas resulting from a leak in the contractor's service pipes, which extend from the contractor's mains to the base of each lamp post, or in the riser pipe, which extends from the base of each lamp post to the burner at the top, or from failure on the part of the contractor to comply with any or all of the conditions of these specifications, or from any act or omission of said contractor or its agents, or from claims based on patents or alleged patents.

Wherever any material, process, composition or thing, called for by these specifications, is covered by letters patent, the successful bidder must secure, before using or employing such material, process, composition or thing, the assent, in writing, of the owner or licensee of such letters patent, and file the same with the Superintendent of Lamps and Lighting.

Whenever the surety or sureties on the bond so furnished shall be deemed by the Mayor to be insufficient or unsatisfactory, the contractor, within ten days after notice to that effect, shall furnish and deliver a new bond to the Mayor and City Council of Baltimore, in the same penalty and on the same conditions, with surety satisfactory to the Mayor, and this duty shall continue on the part of the contractor, whenever and as often as the Mayor shall require a new bond with a satisfactory surety or sureties. If the contractor shall fail to furnish such bond within ten days after said notice mailed to his address, the Mayor and City Council of Baltimore, through its proper agent or agents, may stop all further work under said contract and relet the unfinished work at the expense of the contractor.

Power of Board of Awards.

6. The Board of Awards reserves the right to reject any or all bids.

Plan of Bids to Be Submitted.

7. Bidders will be required to submit separate bids according to the following plans:

(*a*) State in the bid the price of gas to be consumed by each lamp per annum; each lamp not to exceed four thousand (4,000) burning hours in any one year, or to burn more than two and one-half (2½) cubic feet of gas in any one hour.

(*b*) State in the bid the price of gas to be consumed by each lamp per annum; each lamp not to exceed four thousand (4,000) burning hours in any one year or to burn more than three cubic feet of gas in any one hour.

(*c*) State in the bid the price of gas per thousand cubic feet, based upon a total annual consumption of gas at about 90,000,000 cubic feet, which shall include the gas consumed in all street lamps, the City Hall, Court House, City Hall Annexes, all the public school houses, market and engine houses, police station houses and halls and in other public buildings or places within the City of Baltimore in which gas is used and for which the city pays.

8. If at any time during the continuance of the contract to be awarded under these specifications, the price of gas should be reduced, either voluntarily by the contractor, or by the Public Service Commission, below the price at which the contract is awarded, then the City shall pay the contractor such reduced prices only in proportion to the reduced price, which may be decided upon.

Excess Gas Burned to Be Paid for in Proportion to Contract Price Per Annum.

9. Any quantity of gas that it shall have been determined has been burned by the city street gas or outdoor lamps during any one month, in excess of the quantity contracted for by the city, the contractor will be paid for such excess quantity of gas, so burned, at a rate in proportion to the contract price per lamp per annum.

Penalty for Failure to Supply Gas to Any Street Lamp.

10. The contractor will be required to furnish the necessary supply of gas at the burner for all street and outdoor gas lamps now in service, or which may hereafter be placed in service, each and every night during the existence of this contract, the quality of gas to conform in all respects to the standard required by ordinance of the Mayor and City Council of Baltimore and to be delivered at a pressure, if possible, not less than two (2) inches and free from undue or violent fluctuations. In the event of any failure to furnish a free and unobstructed flow of gas to any one or more of the street or outdoor lamps during one or more nights during the term of this contract, a deduction shall be made from the monthly bills of the contractor for each and every one of such lamps not so supplied with gas at a rate in proportion to the contract price per lamp per night, unless such failure be due to no fault of the contractor.

Cost of New Service Connections.

11. The contractor will be required to make service connections from the gas main pipes to such additional street and outdoor gas lamps as may hereafter be ordered to be erected by the Superintendent of Lamps and Lighting, the city agreeing to pay a flat rate for material and labor used in connecting each lamp by the contractor; this payment to cover the cost of laying the service pipes and making the connections from the gas mains to each lamp to the point of burning and shall include the cost of excavating and refilling the trench and repaving cobble stone or other unimproved pavements. If during the term of the contract it shall become necessary for the contractor, upon order of the Superintendent of Lamps and Lighting, to open an improved pavement for the purpose of laying service pipes to additional lamps or for the transfer of existing lamps, the city agrees to pay the contractor the actual cost for opening and restoring the improved pavement in addition to the flat rate, or fixed charge, for the service pipe connections or the disconnection of the service pipes from the lamps to be transferred, less the item of expense included in said flat rate or fixed charge for opening and restoring the cobble stone pavements or for any other character of unimproved pavement.

Changes of Locations of Street Lamps.

12. The contractor will be required to make such changes of locations of street lamps and alterations in the service pipes or connections supplying with gas the gas lamps now in service and additional lamps which may hereafter be placed in service, as may be ordered by the Superintendent of Lamps and Lighting, and the actual cost only of making all such changes or alterations will be paid to the said contractor by the city. The contractor will be required to place and connect the meters for all new or additional meter lamps. The contractor shall make no charges for the disconnecting of a lamp and lamp post, the use of which is discontinued until the lamp and lamp post are removed from the location where they were standing at the time of such discontinuance upon the order of the Superintendent of Lamps and Lighting.

Service Pipes to Be Kept in Good Condition—Damaged Service Pipes.

13. The contractor will be required to keep his or their supply pipes, or service connections, running from the contractor's main pipes to the city street or outdoor gas lamps up to the burners in good condition and in thorough repair, and as far as possible free from water and other

obstructions, so as to permit an unobstructed flow of gas at all times to each lamp burner under the full pressure as provided, as well as to guard against accidents of any kind that may result from an explosion of gas due to leaks or to defective service pipes. Should any of the supply pipes or service connections become damaged or disconnected in any manner so as to interfere with a free and unobstructed flow of gas as provided, the contractor shall make all the necessary repairs as promptly as possible without cost to the city. If such damage be done by the city or any of its agents or employees, the contractor will be required to make the necessary repairs and the actual cost of making such repairs will be paid by the city.

Gas Burned to Be Determined by Meter Lamps.

14. The quantity of gas consumed by the street gas lamps and in the city buildings mentioned herein shall be determined by meter measurement, in accordance with the provisions of the City Charter and the ordinances of the City Council relating thereto. The meters for the city buildings shall be located and connected in the manner in general use; the meters for the street lamps shall be placed in approximately the first, middle and last lamps in each lamplighter's district, the average of which shall determine the basis of consumption of gas for all other street gas lamps. (The city will maintain a meter post at substantially the beginning, middle and the end of each lamplighter's route and in case any routes are changed during the term of the contract, the necessary changes will be made by the city in the meter posts so that a meter will always be at substantially the beginning, middle and end of each lamplighter's route.)

Lamplighters' Routes.

15. The contractor will be furnished by the city with an accurate description of the lamplighters' routes and the order followed in lighting and extinguishing the lamps, which lamps shall be lighted and extinguished in the order given.

Right of Access to Lamps and Posts.

16. The contractor will be given access to the burners, lamps and lamp posts at all times, in company with a representative of the city, who is to be assigned to that work within three days after written notice to the effect that the contractor desires said access has been

given by the contractor to the Superintendent of Lamps and Lighting; that the contractor at no other times, in no other manner and under no other circumstances, will have access to the said burners, lamps and lamp posts, except when connecting service pipes with new or additional street lamps or when making necessary repairs to service pipes, or when cleaning stopped or frozen pipes. The contractor may make such tests as may be necessary to determine the consumption of gas by the lamp burners, but such tests shall in no event and under no circumstances be used in ascertaining the consumption of gas by the city; the method of ascertaining the consumption of gas being exclusively provided for and determined in Section 14 of these specifications, and the city will use every effort to keep the rate of gas consumption of the burners on the lamps provided with meters uniform with the consumption of burners on the lamps not so provided.

To Be Governed in Work by Ordinances and Acts.

17. The contractor will be governed in the installation, transfer and repair of all street gas lamps in accordance with existing ordinances of the Mayor and City Council and any Acts of the Legislature bearing upon such work.

To Be Paid in Monthly Installments.

18. The contractor will be paid by the city for the gas supplied by said contractor at the contract rate in monthly installments, adjusted according to the number of street lamps in actual use.

(Signed) Robert J. McCuen,
Superintendent of Lamps and Lighting.

BID.

March, 4, 1913.

Honorable Board of Awards,

Care of Richard Gwinn, *City Register,*
City Hall, Baltimore, Md.

Gentlemen—It is hereby proposed to furnish illuminating gas for all the street and outdoor gas lamps operated by the Mayor and City Council of Baltimore under the incandescent mantle system, which are now in service and which may hereafter be placed in service, and for lighting all of the public buildings of the Mayor and City Council within the City of Baltimore.

It is hereby proposed to furnish illuminating gas for all the street and outdoor gas lamps, now in service and which may be hereafter placed in service, operated by the city under the incandescent mantle system, along the lines of the company's mains for a period of one, two, three or five years, beginning March 1, 1913, for six dollars and seventy-five cents ($6.75) per lamp per year, each lamp not to exceed four thousand (4,000) burning hours per year, or to burn more than two and one-half (2½) cubic feet of gas in any one hour. In case the consumption of gas exceeds the quantity stipulated, the excess gas will be charged for at the rate of sixty-seven and one-half (67½) cents per one thousand cubic feet. This price per lamp per year and the price for the excess consumption, as in the past, will be applicable to burners singly on lamp posts or in groups of two, three, four or five lamp burners.

In connection with the furnishing of illuminating gas for all the street and outdoor gas lamps, as above, it is also hereby proposed to furnish illuminating gas for use in the City Hall, Court House, City Hall Annex, all the public school houses, market houses, engine houses, police station houses, and halls and all other public buildings or places of the Mayor and City Council of Baltimore along the lines of the company's mains at the rate of seventy-five (75) cents per thousand cubic feet.

It is also hereby proposed to make a flat charge of $7.50 for material and labor used in making service connections from the gas main pipes to such additional street or outdoor gas lamps as may hereafter be ordered to be erected by the Superintendent of Lamps and Lighting; this payment to cover the cost of laying the service pipe and making connection from the gas main to the point of burning, and shall include the cost of excavation and refilling the trench and repaving with cobble stones or other unimproved pavements.

In cases where service connections are to be installed for lamps intended to be erected at a later date, it is hereby proposed to make a flat charge of six dollars ($6.00) per service for material and labor used in making such service connection, from the gas main pipes to points inside of the curb line designated by the Superintendent of Lamps and Lighting as the proposed locations for such additional street or outdoor gas lamps. This payment to cover the cost of laying the service pipe and making the connection from the gas main to the inside of the curb line, and shall include the cost of excavation and refilling of the trench, and repaving with cobble stones or other unimproved pavements.

In cases where service connections are installed to points inside of the curb line, a flat charge of one dollar and fifty cents ($1.50) per lamp will be made, when the service connections are completed from the inside of the curb line to the point of burning.

It is also hereby proposed, pursuant to Section 12 of the Specifications, to make a charge in case of the disconnecting of a lamp and lamp post to cover only the actual cost incident thereto; said charge will not be made until the lamp and lamp post are removed from the locations where they were standing at the time of such discontinuance, upon the order of the Superintendent of Lamps and Lighting.

The above proposals are made in response to the specifications dated February 19, 1913, of Robert J. McCuen, Superintendent of Lamps and Lighting, and subject to the following provisions in the existing contract for the supply of gas, dated, April 4, 1912, which provisions were incorporated after a full discussion and embody the understanding between the Company and the Mayor and City Council of Baltimore:

"It is understood, however, that the city's claim that the Gas and Electric Company is the owner of the service pipes connecting the Gas and Electric Company's mains with the city's lamp posts or other street or outdoor lamps is not admitted by the Gas and Electric Company, but, on the contrary, is disputed by it; and that nothing in the specifications, bid or this contract is intended to affect the question of the true ownership of said pipes, or to be construed as any admission on the part of the Gas and Electric Company that it is the owner of such service pipes. The foregoing, however, is not intended to impair or lessen in any way any obligation imposed upon the Gas and Electric Company by the specifications as to said pipes, irrespective of the question of ownership.

"It is understood that the Gas and Electric Company is not responsible for the condition of the city's piping to its own lamps on the bridges, in the columns and arms, the property of the city, which supply with gas the cluster lamps at the Mt. Royal Entrance to Druid Hill Park, or in the arms which are attached to the top of each of the city lamp posts of the other cluster lamps used by the city, which arms are the property of the American Street Lighting Company."

In making the above proposal, it is with the understanding that Paragraph 8 of the Specifications shall not be construed to mean that there will be a further reduction in the prices of gas named in this proposal for the city when the new gas rates become effective on July 1, 1913.

Respectfully submitted,

CONSOLIDATED GAS ELECTRIC LIGHT & POWER CO. OF BALTIMORE,

(Signed) CHARLES M. COHN,
Vice-President

CONTRACT.

This Contract, Made this 14th day of April, in the year 1913, by and between The Consolidated Gas Electric Light and Power Company of Baltimore, a corporation duly incorporated under the laws of the State of Maryland, hereinafter called the "Gas and Electric Company," party of the first part, and the Mayor and City Council of Baltimore, a municipal corporation, hereinafter called the "City," party of the second part.

Whereas, The City heretofore advertised for bids for furnishing illuminating gas for all the gas lamps used by the city in lighting the streets, avenues, lanes, alleys, bridges, public parks, squares and places, and for use in lighting the public buildings within the City of Baltimore, subject to all of the conditions, covenants, stipulations, terms and provisions contained in certain specifications, a copy of which is hereto attached, and in all respects made a part hereof; and

Whereas, The Gas and Electric Company duly submitted a bid therefor, subject to all of the conditions, covenants, stipulations, terms and provisions contained in said bid, a copy of which is hereto attached, and in all respects made a part hereof; and

Whereas, Said bid was duly accepted and the contract for furnishing illuminating gas duly awarded to said Gas and Electric Company, said contract to run for a period of one year, counting from the first day of March, 1913, and ending on the twenty-eighth day of February, 1914; and

Whereas, It was one of the conditions of said award that a formal contract should be executed by and between the said Gas and Electric Company and the City evidencing the terms of said award.

Now, Therefore, This Contract Witnesseth: That the said Gas and Electric Company doth hereby covenant and agree with the City that it will well and faithfully furnish the said illuminating gas for all the gas lamps used by the City in lighting the streets, avenues, lanes, alleys, bridges, public parks, squares and places along the line of its mains, and for use in lighting the public buildings along the line of its mains, within the City of Baltimore, in accordance with each and every one of the conditions, covenants, stipulations, terms and provisions contained in said specifications, bid and award, and will well and faithfully comply with and perform each and every obligation imposed upon it by said specifications, bid and award.

The City doth hereby covenant and agree with the Gas and Electric Company that it will make payment to the said Gas and Electric Company for the said illuminating gas so used strictly in accordance with the terms of said specifications, bid and award, and that it will well and faithfully comply with and perform each and every obligation imposed upon it by said specifications, bid and award.

It is understood, however, that the City's claim that the Gas and Electric Company is the owner of the service pipes connecting the Gas and Electric Company's mains with the City's lamp posts or other street or outdoor lamps is not admitted by the Gas and Electric Company, but, on the contrary, is disputed by it; and that nothing in the specifications, bid or this contract is intended to affect the question of the true ownership of said pipes, or to be construed as any admission on the part of the Gas and Electric Company that it is the owner of such service pipes. The foregoing, however, is not intended to impair or lessen in any way any obligation imposed upon the Gas and Electric Company by the specifications as to said pipes, irrespective of the question of ownership.

It is also understood that the Gas and Electric Company is not responsible for the condition of the City's piping to its own lamps on the bridges in the columns and arms, the property of the City, which supply with gas the cluster lamps at the Mt. Royal Entrance to Druid Hill Park, or in the arms which are attached to the top of each of the City lamp posts of the other cluster lamps used by the City, which arms are the property of the American Street Lighting Company.

It is further understood and agreed that certain paragraphs of Section 5 of the specifications, specifically referred to in the bid of the Gas and Electric Company, shall not be taken as part of the specifications.

IN WITNESS WHEREOF, The said Consolidated Gas Electric Light and Power Company of Baltimore has caused these presents to be signed by its Vice-President, and its corporate seal, attested by its Secretary, to be duly affixed hereto, and the City has caused these presents to be signed by the Mayor of Baltimore city, and its corporate seal to be hereto affixed, attested by the City Register.

BOND.

KNOW ALL MEN BY THESE PRESENTS, That we, THE CONSOLIDATED GAS ELECTRIC LIGHT AND POWER COMPANY OF BALTIMORE, a corporation duly organized under the laws of the State of Maryland, Principal, and the FIDELITY AND DEPOSIT COMPANY OF MARYLAND, a corporation organized under the laws of the State of Maryland, having its principal office in the City of Baltimore, Maryland, and the AMERICAN BONDING COMPANY OF BALTIMORE, a corporation organized under the laws of the State of Maryland, having its principal office in the City of Baltimore, Maryland, Sureties, are held and firmly bound unto the Mayor and City Council of Baltimore in the full and just sum of seventy-five thousand dollars ($75,000), lawful money of the United States, to be paid to the said Mayor and City Council of Baltimore, or to its certain attorney, to which payment, well and truly to be made and done, we bind ourselves, our successors and assigns, jointly and severally, firmly by these presents.

WHEREAS, The above bounden, The Consolidated Gas Electric Light and Power Company of Baltimore, has entered into a contract with the said Mayor and City Council of Baltimore, bearing even date herewith, for the furnishing of illuminating gas for all the gas lamps used by the city in lighting the streets, avenues, lanes, alleys, bridges, public parks, squares and places, and for lighting the public buildings in the City of Baltimore, upon certain terms and conditions in said contract more particularly mentioned; and

WHEREAS, It was one of the conditions of the award of the Board of Awards of the said Mayor and City Council of Baltimore, pursuant to which said contract was entered into, that these presents should be executed.

Now, therefore, The condition of this obligation is such, that if the above bounden, The Consolidated Gas Electric Light and Power Company of Baltimore shall in all respects comply with the terms and conditions of said contract and its obligations thereunder, including the specifications therein referred to and made a part thereof, and shall indemnify and save harmless the said Mayor and City Council of Baltimore against any suit or suits, loss, damage or expense, by reason of any default, negligence, want of skill or care, on the part of the said The Consolidated Gas Electric Light and Power Company of Baltimore, its agents or employees, or of any sub-contractor in or about the performance or execution of said contract, including said specifications, and from and against any claim, suit, loss, damage or expense arising from the use by the said The Consolidated Gas Electric Light and Power Company of Baltimore, its agents or employees, or any sub contractor, in the performance of its said contract, including said specifications, of any form of material, method of manufacture, machinery, process, composition or thing which is patented, or claimed to be patented, then this obligation to be void; otherwise to be and remain in full force and virtue in law.

In Witness Whereof, The said The Consolidated Gas Electric Light and Power Company of Baltimore has caused these presents to be signed by its Vice-President, and its corporate seal, attested by its Secretary, to be duly affixed hereto; and the said Fidelity and Deposit Company of Maryland, the American Bonding Company, have caused these presents to be signed by their Vice-Presidents and their corporate seal attested by their Assistant Secretary to be duly affixed hereto.

Cost of excess gas ornamental lamps on North Charles street, public squares, etc., over the regular monthly consumption of three cubic feet	1,557 99	
Connecting gas service from main to lamp post	4,544 36	
Connecting gas service from main to curb	3,112 28	
Connecting gas service from curb to lamp post	46 50	
Changing from plain to ornamental posts	195 35	
Changing position gas lamps	1,192 54	
Transferring gas lamps	1,470 18	
Cutting off gas service pipes from unused posts	474 63	
Lowering gas service pipes	5 62	
Ornamental lamp posts—Baltimore design	1,165 97	
Ornamental lamp post fixtures	105 79	
Plain iron lamp posts	3,562 65	
Index doors and casings	24 00	
Hardware, machine supplies, oil and paints	280 25	
Livery—four horses and vehicles	1,175 00	
Cost of Studebaker (25 H. P.) automobile and freight	907 00	
Storage, repairs and hiring of automobile	184 81	
Enameled iron street and zone signs	38 98	
Ruby glass street signs	371 51	
Team hire—hauling posts and material	108 00	
Amounts carried forward	$177,822 09	$179,742 60

Amounts brought forward	$117,822 09	$179,742 60
Repairs to Department wagon	31 67	
Lettering street names on lamp globes	183 40	
Automobile license fee	12 25	
Repairing test gas meter	16 13	
Pentane for testing purposes	12 25	
Car fare	27 50	
Blue printing	2 48	
Filing boxes for blue prints	45 00	
Extending gas main service	29 40	
Lumber	9 65	
Freight and express charges	12 05	
Stationery	4 90	
Extra labor and salaries incident to this account	1,203 88	
Cement and stone	2 10	
Total expenditures		179,414 75
Unexpended balance December 31, 1913		$327 85

TABLE A—III.

THE AMOUNT OF APPROPRIATION AND THE AMOUNT OF EXPENDITURES FOR ELECTRIC LIGHTING AND MAINTENANCE.

Original appropriation		$257,340 81
Appropriation from Contingent Fund (Board of Estimates)		444 60
Cash receipts for material and labor		346 86
		$258,132 27

EXPENDITURES.

Cost of operating arc lamps, all-night service overhead districts, as per contract	$93,179 76	
Cost of operating arc lamps, all-night service underground districts, as per contract	54,939 85	
Cost of operating arc lamps, half-night service underground districts, as per contract	5,702 20	
Cost of operating "White Way" all-night luminous arc lamps, as per contract	20,753 22	
Cost of operating "White Way" half-night luminous arc lamps, as per contract	12,477 28	
Amounts carried forward	$187,052 31	$258,132 27

Amounts brought forward	$187,052 31	$258,132 27
Cost of operating 24 marginal arc lamps, adjacent to parks and squares, as per contract	1,557 76	
Cost of operating 40 candle-power incandescent electric lamps in streets and alleys	16,641 60	
Electric current for incandescent lamps in markets and on bridges, meter measurement	6,714 16	
Electric current for incandescent lamps, Charles Street Boulevard, University Parkway and Thirty-ninth street, meter measurement	1,401 92	
Electric current for No. 6 Engine House clock	116 94	
Luminous "White Way" arc lamps	2,028 69	
Holders and cut-outs for lamps	106 41	
Tungsten and carbon lamps	561 36	
Time switches	261 00	
Repairing "White Way" arc lamp connections	1,331 28	
Connecting new arc lamps	803 66	
Transferring arc lamps	3,620 45	
Balance due Electric Company for installing "White Way" lamps	21,960 26	
Cost of subway connections for Charles Street Boulevard and University Parkway	1,306 22	
Electrical material and supplies	356 12	
Patterns, hardware and tools	342 83	
Wires and cables	457 50	
Special illumination for National Democratic Convention	8,677 98	
Special illumination for Eagles' and Ad Men's conventions	1,586 93	
Special illumination for Colored Knights of Pythias Convention	462 80	
Standardized incandescent bulbs	10 20	
Removing bases—underground lamps	19 75	
Team hire—hauling	4 50	
Expressage and freight	63 24	
"Alba" lamp globes	230 46	
Cement, granite, gravel and lumber	56 53	
Extra labor and salaries, incident to this account	323 63	
Miscellaneous items, advertising, photographs, blue printing, etc.	54 23	
Total expenditures		258,110 72
Unexpended balance December 31, 1913		$21 55

TABLE A—IV.

THE AMOUNT OF APPROPRIATION AND THE AMOUNT OF EXPENDITURES FOR NAPHTHA LAMPS AND MAINTENANCE.

Original appropriation	$9,312 00
EXPENDITURES.	
Total cost for maintaining and operating naphtha lamps, which includes rental of burners, mantles, fixtures, repairs and lamplighters' salaries, as per contract	8,088 23
Unexpended balance December 31, 1913	$1,223 77

TABLE A—V.

THE AMOUNT OF APPROPRIATION AND THE AMOUNT OF EXPENDITURES FOR INCIDENTALS.

Original appropriation		$350 00
EXPENDITURES.		
Advertising proposals	$78 59	
Postage stamps	51 35	
Printing annual report	38 30	
Premium—insurance on automobile	69 25	
Express and freight charges	28 57	
City directory	7 00	
Typewriting specifications	27 76	
Typewriter repairs	15 00	
Premium—indemnity bond	5 00	
Car fare	14 90	
Stationery	8 05	
Blue prints	4 98	
Notary fees	1 25	
Total expenditures		350 00

TABLE B.

SUMMARY SHOWING THE AMOUNT OF APPROPRIATIONS, EXPENDITURES AND BALANCES FOR THE YEAR ENDING DECEMBER 31, 1913.

ACCOUNT.	Amount of Appropriation.	Expended for the Year Ending Dec. 31, 1913.	Balances Dec. 31, 1913.
Salaries	$16,788 00	$16,506 51	$281 49
Gas lighting and maintenance	179,742 60	179,414 75	327 85
Electric lighting and maintenance	257,340 81	258,110 72	21 55
Electric lighting received from Contingent Fund	444 60		
Electric lighting received for labor and material	346 86		
Naphtha lighting and maintenance	9,312 00	8,088 23	1,223 77
Incidentals	350 00	350 00	....
Totals	$464.324 87	$462,470 21	$1,854 66

RECEIPTS, YEAR 1913.

Sales of old material	$44 32
Recovered damages	35 74
Total for year ending December 31, 1913	$80 06

TABLE C.

SHOWS THE AMOUNT REQUIRED FOR YEAR ENDING DECEMBER 31, 1914.

The appropriation for salaries will cover the expense of the office and inspectors	$16,996 00
The appropriation for gas lighting and maintenance will cover the cost of gas for street lamps, squares, markets, and bridges, rental of burners, incandescent mantles, fixtures and repairs, and salaries of lamplighters, transfer of lamps, keep of horses and wagons, street signs, labor, etc.	212,045 50
The appropriation for naphtha lighting and maintenance will cover the cost of gasoline and filling the fluid-burning lamps,. rental of burners, mantles, fixtures, repairs and salaries of lamplighters, transfer of lamps, etc.	9,504 00
The appropriation for electric lights will cover the cost of electric arc lights for the streets, squares, markets, bridges, and incandescent lights in No. 6 Engine House clock, bridges, markets, boulevards and for the transfer and alteration of lamps, etc.	283,422 55
Extension of "White Way" luminous arc lamp system	20,000 00
The appropriation for incidentals will cover the expense for advertising, Directory, postage, etc.	300 00
Total	$542,268 05

Total Cost of Street Lighting—1879 to 1913, Inclusive.

Year.	Gas.	Electric.	Naphtha.	Total.
1879	$151,338.53	....	$22,432.00	$173,770.53

INVENTORY OF THE PROPERTY

OWNED BY THE CITY AND USED IN OPERATING THE STREET LIGHTING SERVICE ENDING DECEMBER 31, 1913.

On Streets.

416	"Baltimore" design luminous arc "White Way" posts and lamps.
12	Five-light cluster electric lamp posts.
8,995	Gas lamp posts.
5,475	"Miner" lanterns.
1,205	"Boulevard" lanterns.
206	Posts with street and hospital zone signs attached.
27,389	Glass and enamel street signs (estimated).
253	Ornamental "Baltimore" posts and lamps.
259	Ornamental "Baltimore" design electric lamp posts and globes.

City Hall (Cellar).

1,035	Enameled street signs.
100	"Miner lamps and frames.
1	Forge.
1	Anvil.
1	Brake.
4	Manville Stakes.
2	Sets block and tackle, one chain.
200	Two-inch lag bolts.
3	Crowbars.
3	Long-handled shovels.
1	Short-handled shovel.
1	Rammer.
200	Bricks.
1	Load sand.
95	Regular sign brackets.
1	"Clyde" sign-post.
1	Bag cement.
1	Lifting bar.
12	18-inch by ⅝-inch bolts.
29	1¼-inch couplings.
1	Double "Y."
1	Templet.
3	1¼-inch by ¼-inch bends.
4	¾-inch by 1¼-inch bends.
1	Rake.
38	¾-inch caps.

1 Candle power testing machine.
7 Three-quarter to one-half reducers.
1 Cubic foot box.
3 ¾-inch couplings.
2 1½-inch caps.
1 Roll wire.
6 Top boards for ornamentals posts.
20 Cut-out board for ornamental posts.
20 Cut-out boards for "White Way" posts.
5 Irons for "White Way" posts.
30 1¼-inch by ⅜-inch machine bolts.
1 Stand.
108 60-watt Mazda lamps.
107 40-watt Mazda lamps.
170 60-candlepower Mazda Lamps.
51 100-watt Mazda lamps.
3 Series sockets.
1 Globe.
500 Sign block numbers.
6 Dial plates.
2 Swedges.
1 Sledge hammer.
1 Stove.
1 Tongue.
1 Wheelbarrow.
1 Lot iron junk.
11 Small lamp globes.
63 Large lamp globes (six globes open top and bottom).
3 "Miner" boulevard lamps.
10 Reflectors.
1 Lot electrical wire..
6 Regular arms.
3 Step-ladders.
1 Drill press.
1 Derrick.
275 Feet of rope.
1 Large shear.
1 Roller.
1 Groover.
100 Old bracket signs and fixtures.
18 "Hospital Zone" signs.
2 Cable pulling heads.

1 Fire-pot.
1 Six-inch metal-pot.
1 Three-inch ladle.
1 Water bucket.
1 Machinists' vice.
1 Cement roller.
1 Cement groover.
1 Cement trowel.
1 Two-foot gas meter proover.
1 Electric meter testing bench.
27 Series lamp sockets (six without sockets).
1 Cable pot head without top.
2 Gross 1½-inch brass machine screws (14-20).
700 Expansion bolt shields.
4 Bars block tin.
30 Gross ⅝-inch roundhead brass machine screws (10-24).
27 Gross 10-24 hexagon brass tapped nuts.
50 Feet hard brass wire (for signs).
5 Rolls ¾-inch "Rex" black friction tape.
100 Feet ¾-inch pipe.
2 ¾-inch pipe crosses.
111 1½-inch pipe.
6 Meter post casings.
12 Five-opening brass fittings.
3 Stands for ornamental lamps.
4 Ventilators.
25 "Paiste" plug cut-outs, No. 2965.
7 Porcelain socket holders.
91 Feet 2-inch pipe.
33 1½-inch pipe crosses.
287 Old "Clyde" signs.
33 1½-inch to ½-inch reducers.
1 Reel No. 0 lead cable.

City Yard (Low Street).

113 Cross-arms.
36 Acorns for ornamental lamp posts
4 Ornamental lamp post bases
2 Regular lamp post bases
9 Regular lamp post urns
55 Bracket-arms.
13 Pine-apple post tops.

113 Standard iron posts.
1 Meter post.
7 Five-light cluster electric lamp posts (complete).
1 Lot old iron junk (estimated at 500 pounds).

City Yard (Hunter Alley).

6 "White Way" lamp posts.
3 Standard lamp posts.
20 Cross-arms.
1 Reel No. 6 lead cable.
1 Reel No. 8 lead cable.
2 Picks and four handles.
2 3¾-inch brick drills.
2 Pointers.
2 Chisels.
122 Block numbers.
2 Gallons black paint.
13 Two-inch to 1½-inch reducers.

Laboratory.

8 Newman time-clocks.
1 100-inch Dwyer Machine Company electric photometer.
1 "100" Letheby bar photometer.
1 Standard "Harcourt" pentane lamp.
1 Improved "Lowe" jet photometer.
1 Six-inch syphon water gauge
1 Round glazed test meter.
1 Square glazed test meter.
1 Water balanced recording pressure gauge.
1 "Taglibeau" open coal oil tester.
3 Hydrometers (oil).
3 25 C. C. syphon Burette tubes.
1½ Gross standard half-pint glass bottles.
8 Leather oil collector cases.
1 Balance stand
1 Hammer.
1 Screwdriver
1 "Underwood" typewriter.
1 Typewriter desk.
1 Metallic fire-proof record case.
1 Letter press and book.

1 Electrical volt meter.
1 Electrical am-meter.
1 Two-foot gas meter proover.
Miscellaneous glassware (Laboratory).
Necessary record books, etc.

In Electrical Laboratory.

3 Siemens & Halske D. R. precissions dynamometer type watt meters.
1 Siemens & Halske calibrating rheostat or load box.
1 Combination table for instrument testing and checking.
2 Form "P" portable current transformers.
1 Moving coil milli-voltmeter.
1 Moving coil voltmeter.
5 Manganin shunts—various ranges.

At Livery.

1 Horse, 1 robe, 1 buggy, 1 set harness, 1 blanket, whip, etc.

1914

SEWERAGE COMMISSION

OF THE

CITY OF BALTIMORE

AMERICAN BUILDING

BALTIMORE, December 31, 1913.

HON. JAMES H. PRESTON,

Mayor of Baltimore.

SIR:

In accordance with Section 1, Chapter 349, Acts of the General Assembly of Maryland, 1904, which requires the Sewerage Commission to annually make to the Mayor a detailed statement of its work and expenditures, we beg to submit the following report:

The death of Mr. William D. Platt, on December 23, 1913, deprived the Commission of a most useful member, and the City of a faithful servant. He was one of those originally appointed by the Mayor of Baltimore, June 19, 1905, and upon the organization of the Commission was elected vice-chairman. In the performance of all his duties he was faithful and efficient, and because of his many estimable traits he was highly esteemed by his colleagues.

On December 31, 1913, Thomas J. Shryock was appointed to fill the vacancy caused by the death of William D. Platt.

ACCOUNTS AUDITED.

The books, accounts and vouchers of the Commission have been examined by the Baltimore Audit Company, from the date that the last report was submitted to you to the close of business December 31, 1913. The Audit Company reported that they had examined the books and accounts for 1913, which included the examination of original vouchers at the Comptroller's office in the City Hall, and are pleased to state that everything is correct.

EXPENDITURES, 1913.

A complete and detailed statement of disbursements for the year 1913 has been furnished the City Comptroller, as follows:

Administrative salaries	$27,773 19
Construction salaries	239,812 31
Pumping Station salaries	16,643 51
Disposal Plant salaries	22,014 02
Cement Laboratory salaries	6,042 86
Repairing and Cleaning Sewers salaries	12,035 15
Pumping Station expenses	10,625 00
Disposal Plant expenses	5,993 16
Cement Laboratory expenses	705 46
Repairing and Cleaning Sewers expenses	259 34
Special expenses	35,641 23
Construction	3,712,891 50
Amount expended in 1913	$4,090,436 73

The items, Salaries and Expenses of the Pumping Station, Disposal Plant and Repairing and Cleaning Sewers, aggregating $67,570.18, are in fact maintenance cost. As a large number of taxpayers are being served by their operations, these expenses should not be considered in connection with construction.

The details of the construction represented by this large sum are given in the report of the Chief Engineer, submitted herewith. The accomplishment of so much work under varying conditions and many obstacles, is evidence of the high efficiency of the Engineering Department, and also entitles the employes of the Administrative Department to much credit for their accuracy and promptness in handling the accounts and vouchers, as stated in the report of the Audit Company.

CONTRACTS LET IN 1913.

Sanitary Contract No. 107, Frank Bruno & Co.	$118,893 52
Sanitary Contract No. 108, W. H. Thompson Cons. Co.	19,833 20
Sanitary Contract No. 109, Carozza, Lavezza & Carozza.	97,702 43
Sanitary Contract No. 110, McCarthy & O'Herron.	147,768 94
Storm-water Contract No. 26, McCarthy & O'Herron.	258,222 45
Storm-water Contract No. 27, Ryan & Reilly.	39,610 05
Sanitary Contract No. 111, Middleton-Thompson Co.	157,763 40
Sanitary Contract No. 114, C. B. Clark & Co.	100,162 40
Sanitary Contract No. 115, Carozza, Lavezza & Carozza.	26,042 49
Sanitary Contract No. 116, Gallagher, Boyle & Bryan.	190,001 80
Storm-water Contract No. 28, Guild & Co.	97,993 10
Storm-water Contract No. 29, Whiting-Turner Cons. Co.	12,262 00
Sanitary Contract No. 117, W. H. Thompson Cons. Co.	51,658 75
Sanitary Contract No. 118, McCarthy & O'Herron.	77,069 70
Sanitary Contract No. 121, Whiting-Turner Cons. Co.	65,868 50
Storm-water Contract No. 30, McCarthy & O'Herron.	93,916 75
Sanitary Contract No. 113, John Dannini.	2,035 73
Storm-water Contract No. 31, Ryan & Reilly.	31,382 90
Sanitary Contract No. 120, Whiting-Turner Cons. Co.	55,947 50
Storm-water Contract No. 32, Guild & Co.	26,805 20
Sanitary Contract No. 119, Gallagher, Boyle & Bryan.	176,154 75
Sanitary Contract No. 122, James Ferry & Sons.	52,426 90
Storm-water Contract, No. 33, Ryan & Reilly Co.	103,303 20
Sanitary Contract No. 124, Carozza Brothers Co.	80,552 25
Storm-water Contract No. 34, James Ferry & Sons.	7,242 50
Sanitary Contract No. 112, Samuel T. Williams.	9,092 00
Sanitary Contract No. 128, McCarthy & O'Herron.	138,637 85
Total.	$2,238,350 26

DISPOSAL PLANT.

From time to time we have conferred with our Consulting Engineers as the work has progressed. As the Disposal Plant has only been put in operation to a limited extent, we thought it wise during the past year to have Mr. Rudolph Hering visit the plant and study its operation. He spent some time in making a thorough investigation of the problem presented, and has made a number of valuable suggestions, which either have been or will be acted upon. It is to be borne in mind that the highest degree of efficiency of the Disposal Plant is not likely to be reached until a larger proportion of the sewage of the City shall have been brought into treatment.

SLUDGE DISPOSAL.

In our last annual report reference was made to the possibility of the use of sludge as a fertilizing material. This question is still under investigation, and it is hoped that before long we shall have sufficient data to enable us to form a definite opinion on the subject. There is no doubt that sewage contains substances that are of importance in the cultivation of the soil; but it remains to be determined whether these can be separated from the sewage in sufficiently concentrated form at a sufficiently low cost to give them commercial value.

APPROPRIATIONS FOR FUTURE WORK.

The appropriation for sewer work for the year 1914 will exhaust the funds provided under the Sewerage Enabling Acts of 1904 and 1910. These two loans were intended to provide $20,000,000, but because the Sewerage Stock could not be disposed of at par at a rate of interest most advantageous to the City, the sum actually available for all purposes will be approximately $18,900,000. Nevertheless, the two loans would be sufficient to do the work of sewering and draining the built-up portions of the City and Annex, existing at the time the first estimates were made. These estimates will be found in the annual report of the Commission for 1907, which stated that the cost of the sanitary sewers as outlined in the report for 1906 would be about $14,000,000, and that the entire storm-water system could be properly constructed for about $4,500,000. These estimates were based upon a system of sewers designed to use the streets and alleys bringing a connection to every house in the City in such a way as to reduce the total number of miles of sewers to a minimum. The Legislature of 1910 passed an Act requiring the Commission to lay sewers in the alleys wherever practicable. It is estimated that this requirement increases the cost of the system about $1,000,000. When the first estimates were made, it was understood that the work of the Commission would stop at the outside building line. It has since been decided to carry the front connection to the inside of the wall of the building, enabling the owners of small properties to connect their buildings with the City's sewers at less cost to them, adding to the cost of the system for this item approximately $250,000. These changes, with the discounts on sales of Sewerage Stock, have reduced the amount considered available for construction of the sanitary and storm-water systems as contemplated in the original estimates, making the extension of sewers in the rapidly developed outlying portions of the City a serious problem with which to deal. The Commissioners for Opening Streets during the year made request for drainage construction in streets outside of the territory included in the original plan. The City Solicitor had advised them that the Act placed on the Sewerage Commission the duty of providing for the sewerage and drainage in connection with the new streets in the Annex. The Sewerage Commission was obliged to inform the Commissioners for Opening Streets that a certain amount of work had been planned in the built-up sections of the City which would exhaust all of the remaining funds. Moreover, it would be most unfair to the taxpayers residing in the congested section of the City, who had been paying taxes for years, to go into the outlying parts where houses were few and far between and expend the money remaining at our disposal for drains, thus depriving the crowded sections of the City of much-needed sewerage privileges. In order to provide sewers and drains for these outlying districts, a further appropriation will be necessary to replace the funds the Commission was deprived of by shrinkage in the amount available on account of the above items. It is safe to say that the work can be brought to a state that might be called practical completion, with the further appropriation of $3,000,000. It appears to the Commission that the extension of the sewers can be done more economically and promptly by the present organization (both administrative and engineering) than later on taking it up under a new organization.

Respectfully,

CHARLES ENGLAND, *Chairman.*
JAMES H. PRESTON, *Ex officio.*
MORRIS WHITRIDGE.

GUSTAV SIEGMUND.
THOMAS J. SHRYOCK.

HARRY W. RODGERS, *Secretary.*

ANNUAL REPORT

OF THE

CHIEF ENGINEER

FOR THE YEAR 1913

BALTIMORE, December 31, 1913.

MR. CHARLES ENGLAND, *Chairman; and*
Gentlemen of the Sewerage Commission.

DEAR SIRS:

I have the honor to present to you a report upon the work done by the Engineering Department of the Commission from January 1, 1913, to December 31, 1913.

The total value of the work completed during the year was about $3,875,000. This embraces 139 miles of sewers, drains and house-connections, varying in size from 5 inches to 29 feet in diameter, in the beds of the streets and alleys of the City, and 1,541 catch-basins, and includes such work as the enclosing of Jones Falls, the diversion tunnel under Guilford avenue, the large 12x18-foot storm-water drain in Linwood avenue, and 18 acres of extensions and improvements to the Disposal Plant.

The difficulties and details necessary in constructing this amount of sewers and drains, in streets and alleys filled with all kinds of obstructions, is difficult to make clear to a layman, but is fully appreciated by engineers.

The sewer construction in Baltimore is further greatly complicated because of the Enabling Act requiring all sewage to be purified, necessitating the separating of the storm-water from the sanitary sewage, thereby requiring the building of two separate systems of sewers and drains, crossing and recrossing each other in thousands of places. The supporting of buildings and taking care of the surface drainage and traffic is also a difficult problem, considering the scope of the work. The number of complaints, compared to the amount of work, shows that the work has been carried on with the minimum amount of interference with corporations, other City Departments, property-holders and traffic. The few law suits that have been instituted against the City, in connection with our work, have resulted in the City winning practically all of the cases, with one or two small exceptions.

JONES' FALLS.

The construction of the Jones' Falls Conduits has been completed from 100 feet south of Baltimore street, at which point the drainage problem has been solved, to the chamber at the entrance to the tunnel between Biddle and Chase streets, a distance of 5,484 feet, redeeming 428,300 square feet of land in the heart of the City, eliminating ten street bridges and one double-track railroad bridge and making possible the redemption of 175,000 additional square feet of land and the elimination of two additional railroad bridges.

This work, being in the bed of a running stream, subject to sudden floods, has been a most trying piece of construction, and it is therefore with considerable gratification that I am able to report it has been completed without law suits or serious loss to the contractor.

DIVERSION TUNNEL UNDER GUILFORD AVENUE.

The diverting of the Falls at a point in front of Union Station into a 29-foot tunnel under Guilford avenue, effected a very large saving by eliminating the long bend in the Falls, shortening the construction about 700 feet and giving a large quantity of excellent rock from the tunnel for the concrete necessary in the construction, which factor secured a much lower bid from the contractor, and effected a saving to the City of approximately $150,000.

The tunnel is 75 per cent. completed—the excavation at the southerly end being within 110 average feet of the the retaining wall of the Falls, between Biddle and Chase streets; the northerly end being within 97 average feet of the retaining wall in front of Union Station, and the concrete lining having been completed for a distance of 574 feet.

The difficulties the contractor has encountered in this construction have been many, and I regret to say that the subcontractor, Lane Brothers Company, is one of the few contractors we have had to fail on us during the expenditure of some seventeen million dollars, involving many difficult pieces of construction. The original contractors, Fisher & Carozza, however, took over the work promptly and are pushing it in a much better manner that the sub-contractor was doing.

I am pleased to say, further, that for the past year we have been carrying the flow of Jones' Falls through the east conduit, which was built for the ordinary flow, and although this conduit is the smallest of the three, on account of the smooth bore and calculated grades it has been able to take care of practically all the heavy storms we have had, which verifies our calculations in a most satisfactory manner.

PUMPING STATION.

It is a pleasure to report that the three 27,500,000-gallon pumps, which were put into operation on January 31, 1912, have worked in a most perfect manner since that time, and have been one of the means of relieving the odor from the harbor until we were able to intercept a sufficient amount of sewage to give permanent relief. This was done by intercepting a large portion of the flow of Jones' Falls and pumping in to the Disposal Plant, there purifying it. On account of the rapid introduction of the sewerage system around the harbor, allowing us to intercept the sewage flowing into the harbor, we were able to discontinue the pumping of water from Jones' Falls on May 30, 1913. A sufficient number of houses in the low-level district have been connected to require the employment of three shifts at the Pumping Station, keeping the force at work day and night.

DISPOSAL PLANT.

At the time of starting the construction of the sewerage system we found available $10,000,000 in bonds, being half of the amount necessary, according to our estimate. Not knowing whether sufficient funds to complete the entire system would become available later on, I endeavored to lay out the expenditure of this money in such a way, by building a certain amount of sewers in the City with a sufficiently large Disposal Plant at Back River, as to make the expenditure available as a working plant as far as the money went. This resulted in our constructing a Disposal Plant at Back River capable of taking care of 275,000 people. Immediately on the voting of the additional funds to complete the system (which loan, I am informed, passed by the largest vote ever received in the City of Baltimore), plans were made to bring the Disposal Plant up to a capacity of 600,000 people. Work on this extension has progressed in a satisfactory manner during the year. In the extension, improvements in detail have been made, and the plant is being kept up to the very latest word in sewage disposal, both in this country and abroad. The power and light secured by the flow of the sewage are giving most satisfactory results.

We have turned over to the Health Department about 40,000 houses for connection to the sewers and will have ready in a short time about 20,000 more. I understand that over 30,000 houses have been connected and are now draining to the Disposal Plant.

HYDRO-ELECTRIC PLANT.

In designing the Disposal Plant, arrangements were made to insert turbines at the point where the purified sewage was ready to be discharged into Back River. The flow of the purified sewage operates these turbines, which in turn run dynamos, producing more than sufficient power and light to operate the plant—a feature that stands out unique in sewage disposal, Baltimore being the only place where such power is secured.

FALLSWAY VIADUCT.

In accordance with the action of the Mayor and the Board of Estimates, employing me as Consulting Engineer to carry out the construction of the Viaduct, which action was approved by your Commission, I proceeded and designed the Viaduct along the general lines recommended in my report to the Commission in 1906.

This Viaduct is for the purpose of lifting the road-bed of the Fallsway, constructed over the top of the Jones' Falls reinforced conduits, from the present crossing of Madison street at the intersection of the Falls, to the present grade of Eager street, Chase street and Guilford avenue, crossing the Northern Central tracks above grade.

This contract was awarded to Stewart-Jones Company and Claiborne, Johnston & Company, at their bid of $190,693.15. Later, through the sanction of the City Solicitor, the bonding companies and the Board of Estimates, the Stewart-Jones Company dropped out, leaving the work in the hands of Claiborne, Johnston & Company.

This contract covered the superstructure, over the roof of the conduits, as the foundations had been previously authorized by the Board of Estimates, after arranging with your Commission to construct them in conjunction with the building of the conduits in the bed of the Falls, it being more economical to build the foundations for the Viaduct into the roof of the conduits while the latter were in process of construction. These foundations were constructed at the low unit prices obtained in the conduit work, the cost amounting to about $25,000. Payment for this work is being made by the Commission on monthly estimates, to the contractor for Section No. 2 of the Jones' Falls Conduits, and upon its completion the amount expended is to be repaid to the Commission from the funds apropriated for the construction of the Fallsway.

In designing the Viaduct, the first 438 feet, from Madison street north, starting at nothing and rising to a height of 15½ feet, was of such construction as would not permit of the building of arches from an architectural standpoint. It was designed so as to have the roadway of this portion laid on a fill between retaining walls. In place of letting a contract for the filling in of this space at additional cost to the City, I recommended that this be made a central dump, charging a price per load for dumping earth, thereby receiving a revenue instead of making an expenditure. This fill is proceeding in a very satisfactory manner, and arrangements have just been made with large contractors to begin running the dirt in very rapidly. Therefore, if the weather permits, in the course of a very short time I do not see why traffic cannot be diverted over the portion of the Viaduct from Eager street south, ahead of the paving, if so desired. However, it would be better if arrangements could be made to pave this section ahead of the other paving, immediately on our releasing it, which will be in advance of the fill being completed, if the weather conditions are favorable. This would be desirable from several standpoints. In this connection, careful consideration should be given to the question of the advisibility of using bituminous joints in the paving of the Viaduct, for two reasons: First, we have expansion joints in the floor slab, which will be quite a factor in the future, and bituminous joints in the paving will allow the expansion and contraction to take place much better than a cement joint; second, it will reduce the noise, which is now complained of on the lower section of the Fallsway, where cement filler was used.

While the work on the Viaduct has not moved along as rapidly as desirable, the section between Madison and Eager streets has been a particularly tedious part. The contractor having assembled his plant, from now on, up to the mouth of the tunnel, there is no reason why the work should not proceed much more rapidly. I am pushing the contractor with this object in view.

In this connection, I wish to say that the Pennsylvania Railroad has co-operated with us in a most satisfactory manner, with reference to the adjustment of their tracks at the crossing of the Viaduct.

DESIGNING DEPARTMENT.

On account of the lack of information regarding underground structures, the very extensive ramifications of the sewerage system, the effort to interfere as little as possible with existing structures, and in order to give the contractor as much information as possible in making his bid, we have necessarily had to make extensive investigations of the records of all the City Departments and public service corporations; and, in addition, sink numerous test-pits. This has resulted in adding to our engineering cost, but it has been the means of effecting large savings to the City, by the contractors giving lower prices on account of having this information, and will result in the City having one of the most complete underground maps of any city in the country. It has also enabled us to do our work with the least possible interference with the structures of other City Departments and public service corporations. This has involved, since the beginning of the work, the preparation of 10,500 drawings. Included in this number are 107 record plats which have been entirely completed, and 383 partially completed. These plats, which form the foundation of our contract drawings, show street, lot and curb lines, existing sewers and drains, tracks, pipes and other structures, with depths, sizes and materials.

During the year 1913 we have passed nearly 19,500 permits for connections to the new sewers, requiring the giving of depth and location, and have examined about 2,500 plans submitted by the other City Departments, public service corporations, etc., to see that the proposed structures did not interfere with our work. In addition, about 2,000 plans were furnished for our information by the Gas Company, Telephone Company, etc. Since the beginning of our work, about 15,000 original drawings have been submitted by outside parties, either for approval or for our information, and about 10,000 additional duplicate drawings have been received, showing revisions or changes from the plans originally submitted, making a total of about 25,000 separate outside drawings passed on since our work began.

In planning and executing such work as the Baltimore Sewerage System, either one of two diametrically opposed policies may be followed:

First—The plans and preliminary investigations may be of the most general character, leaving it to the contractor to make detailed investigations and to assume all risks of unknown conditions. If this plan is followed the contractor's prices are necessarily high, in order to cover contingencies.

Second—The plans and preliminary studies may be made in great detail, showing, so far as possible, all underground conditions and obstructions, and leaving as few things as possible to be covered by the contractor's allowance for contingencies. This method results in the lowest prices from the contractors and has been adopted by the Sewerage Commission, with the result that we have secured very wide competition and generally low prices on all of the work which has been done. The saving secured by the lower prices has been many times greater than the additional cost of preparing the plans along the above lines.

TESTING STATION.

The Sewerage Commission's method of testing their cement and having a complete laboratory producing satisfactory results caused the Mayor and Board of Estimates to decide to place the testing of all cement purchased by the City's contractors under the jurisdiction of the Sewerage Commission. The Sewerage Commission having agreed to this proposition, our cement laboratory force was moved to the City Testing Station in July, 1912. During 1913 the laboratory sampled and tested 2,215 lots (representing 1,810,593 bags) of cement. The larger part of the cement tested was sampled in dealers' warehouses, and each bag was tagged, as the cement was intended to be sold in small quantities to different contractors. The cost of this work (sampling, tagging and testing) was unusually low, amounting to about three-quarters of a cent per bag. Where the cement was purchased in large lots to be used on specific pieces of work, the bags were not tagged, and the cost of sampling and tagging each lot of cement amounted to only $2.04. The Commission bills the cost of operating the Cement Laboratory against the various departments by which the cement is used, the charge to each department being based on the amount of cement used by it.

The brands tested embrace the following: Alpha, Atlas, Dexter, Dragon, Edison, Giant, Lehigh, Matcham, Nazareth, Saylor, Security, Tidewater, Universal, Vulcanite and Whitehall.

PHOTOGRAPHY.

In the subway construction in New York we found that the use of photography was a most important factor in our engineering work in saving money to the city in law suits. This feature was introduced in the Sewerage Commission's work from the very start and has resulted in producing evidence that has thwarted a great many law suits and enabled the City to win many others. Our method has been to carefully examine buildings before our work was started, and in the case of any defects, have them photographed; also, elevations taken on curbs and sills. While this has added to the first cost, it has, as stated above, enabled us to save large sums to the City.

NEW PAVING.

In order to meet the strenuous program of paving adopted by His Honor, the Mayor, I am gratified to report that we have been able to keep well in advance of the paving. On December 12, 1913, we called the attention of the Paving Commission to the fact that we had released about 37 miles of streets, in addition to those they had asked us for, which were then available for paving. Since then, we have released additional streets and are about ready to release a considerable number of miles more. This has only been possible by the most strenuous work on the part of everyone connected with the Sewerage Commission.

The pushing of the paving so closely behind such extensive sewerage and drainage work has placed the Commission in a very critical position, as the settlement of these trenches, covering such a tremendous area through various kinds of soils and under masses of pipes, makes a contingency that we have used every effort to overcome. It is therefore gratifying to have had practically no replacing of new pavements over our trenches, demonstrating that unusual care has been exercised in our backfilling.

The proper construction and efficiency of sewers and drains depends on carefully constructing them on calculated grades; and the further fact that sewer work is so quickly covered, makes it a class of work requiring most careful inspection, from both an engineering and inspection standpoint.

I have introduced 50 photographs and 5 tables showing the actual work in progress, in detail, which will give the layman a better idea of the magnitude and variety of the engineering work.

Respectfully submitted,

CALVIN W. HENDRICK,
Chief Engineer.

TABLE No. 2.

STATEMENT OF CONTRACTS LET PRIOR TO 1913.

Contract.	Date of Contract.	Name of Contractor.	Proportion of Work Completed December 31, 1913.
Wash Borings No. 1	July 2, 1906.	B. F. Smith & Bro.	Completed July 28, 1906.
Testing Plant	Oct. 17, 1906.	Malcolm W. Hill Co.	Completed July 1, 1907.
Laboratory	Oct. 18, 1906.	Wm. Kirkpatrick	Completed Feb. 1, 1907.
Storm Water No. 1	Cct. 18, 1906.	M. A. Talbott Co.	Completed April 14, 1908.
Sanitary Sewers—Walbrook	Oct. 29, 1906.	M. A. Talbott Co.	Completed June 27, 1907.
Outfall Sewer, Section No. 1	Dec. 7, 1906.	M. A. Talbott Co.	Completed August 1, 1909.
Outfall Sewer, Section No. 2	Dec. 7, 1906.	M. A. Talbott Co.	Completed August 6, 1908.
Sewage Pumping Plant Mach'y.	Dec. 12, 1906.	Bethlehem Steel Co.	Completed Feb. 18, 1913.
West Low Level Interceptor, Section No. 1	May 1, 1907.	Metropolitan Contr. Co.	Completed March 26, 1908.
West Low Level Interceptor, Section No. 2	May 1, 1907.	Metropolitan Contr. Co.	Completed March 26, 1908.
Outfall Sewer, Section No. 3	May 4, 1907.	J. Connelly Const. Co.	Completed June 7, 1909.
Outfall Sewer, Section No. 7	May 4, 1907.	J. Connelly Const. Co.	Completed Dec. 19, 1908.
Outfall Sewer, Section No. 8	May 4, 1907.	J. Connelly Const. Co.	Completed Nov. 1, 1908.
Outfall Sewer, Section No. 9	May 4, 1907.	A. F. Helm	Completed Oct. 13, 1908.
Outfall Sewer, Section No. 6	May 28, 1907.	David Peoples	Completed Oct. 16, 1908.
Storm-Water No. 2	May 28, 1907.	David Peoples	Completed May 11, 1909.
Storm-Water No. 3	May 28, 1907.	David Peoples	Completed May 15, 1909.
High Level Interceptor, Section No. 1	May 29, 1907.	M. A. Talbott Co.	Completed Nov. 5, 1908.
High Level Interceptor, Section No. 2	May 29, 1907.	M. A. Talbott Co.	Completed May 1, 1909.

TABLE No. 2—*Continued.*

STATEMENT OF CONTRACTS LET PRIOR TO 1913.

CONTRACT.	DATE OF CONTRACT.	NAME OF CONTRACTOR.	PROPORTION OF WORK COMPLETED DECEMBER 31, 1913.
Outfall Sewer, Section No. 4..	May 29, 1907.	M. A. Talbott Co......	Completed March 17, 1909.
Outfall Sewer, Section No. 5..	May 29, 1907.	M. A. Talbott Co......	Completed August 1, 1909.
Outfall Sewer, Section No. 10.	June 10, 1907.	J. Connelly Const. Co....	Completed Nov. 1, 1908.
	NOTE.—This contract was first awarded to J. Erwin Hillpot, but he was unable to furnish satisfactory bond and the contract was reawarded to the J. Connelly Construction Company, the next lowest bidder.		
Sewage Disposal Plant, Clearing and Grubbing Disposal Area	July 8, 1907.	Lane Bros. Co. & Jones..	Completed Sept. 1, 1909.
	NOTE.—This contract was awarded on April 24 to J. Erwin Hillpot, but he was unable to furnish a satisfactory bond and the work was readvertised.		
Digging Test Well on site of Sewage Pumping Station....	July 29, 1907.	**Metropolitan Contr. Co.**	Completed August 27, 1907.

TABLE No. 2—*Continued.*

STATEMENT OF CONTRACTS LET PRIOR TO 1913.

CONTRACT.	DATE OF CONTRACT.	NAME OF CONTRACTOR.	PROPORTION OF WORK COMPLETED DECEMBER 31, 1913.
West Low Level Interceptor, Section No. 3	Feb. 28, 1908.	Metropolitan Contr. Co.	Completed Oct. 30, 1908.
East Low Level Interceptor, Section No. 1	May 8, 1908.	T. J. O'Connell	Completed May 15, 1909.
East Low Level Interceptor, Section No. 2	May 8, 1908.	T. J. O'Connell	Completed May 15, 1909.
Grading Manderson lot	May 8, 1908.	Gustavus Keckel	Completed June 29, 1908.
Sewage Pumping Station, Superstructure	May 9, 1908.	Noel Construction Co.	
Sewage Pumping Station, Substructure	May 9, 1908.	Noel Construction Co.	Completed August 1, 1911.
Storm Water Contract No. 4	June 17, 1908.	Reilly & Riddle	Completed March 16, 1909.
Roadway, Willis avenue	Aug. 7, 1908.	L. B. McCabe	Completed Nov. 30, 1908.
Storm Water Contract No. 5	Sept. 17, 1908.	David Peoples	Completed Jan. 23, 1909.
Roadways on Baltimore Brick Company's property	Sept. 28, 1908.	Thos. Mullan	Completed Dec. 7, 1908.
West Low Level Interceptor, Section No. 4	Oct. 28, 1908.	Metropolitan Contr. Co.	Completed July 10, 1909.
Force Main	Nov. 2, 1908.	Warren F. Brenizer Co.	Completed Oct. 12, 1909.
Force Main Sewer	Nov. 4, 1908.	Ryan & Reilly	Completed Sept. 30, 1909.
Sewage Disposal Plant	Nov. 4, 1908.	New York Continental Jewell Filtration Co.	Completed Dec. 23, 1910.
Storm Water Contract No. 6	Dec. 31, 1908.	Booth & Flinn	Completed Jan. 28, 1910.

TABLE No. 2—*Continued.*

STATEMENT OF CONTRACTS LET PRIOR TO 1913.

Contract.	Date of Contract.	Name of Contractor.	Proportion of Work Completed December 31, 1913.
Filter Stone for Sewage Disposal Plant..................	Dec. 31, 1908.	Fisher & Carozza.......	Completed June 1, 1911.
Sanitary Contract No. 35, Lateral Sewers, District No. 26.	Mar. 6, 1909.	T. Wallace Reilly.......	Completed Oct. 7, 1909.
Sanitary Contract No. 37, Sewage Disposal Plant, Water Tanks and Tower...........	Feb. 19, 1909.	Horace E. Horton (Chicago Bridge and Iron Works)..............	Completed Sept. 1, 1909.
Sanitary Contract No. 38, Lateral Sewers, District No. 28.	April 10, 1909.	Ryan & Reilly..........	Completed Nov. 10, 1909.
Sanitary Contract No. 39, Lateral Sewers, District No. 30.	April 15, 1909.	James Ferry & Sons....	Completed Sept. 25, 1909.
Sanitary Contract No. 40, Forest Park Sewage Disposal Works................	Sept. 15, 1909.	Lane Bros. Co. & Jones.	Completed Oct. 25, 1910.
Sanitary Contract No. 41, Trunk Sewers, District No. 48	Sept. 10, 1909.	T. Wallace Reilly......	Contract abandoned June 15, 1910. 72% of work completed.
Sanitary Contract No. 42, Jones Falls Interceptor, Section No. 1	Sept. 22, 1909.	M. A. Talbott Co......	Completed Oct. 15, 1910.
Sanitary Contract No. 43, Lateral Sewers, District No. 29.	Sept. 11, 1909.	Wm. McCarthy & Co...	Completed April 25, 1910.

TABLE No. 2—*Continued.*

STATEMENT OF CONTRACTS LET PRIOR TO 1913.

CONTRACT.	DATE OF CONTRACT.	NAME OF CONTRACTOR.	PROPORTION OF WORK COMPLETED DECEMBER 31, 1913.
Sanitary Contract No. 44, Lateral Sewers, District No. 21.	Dec. 18, 1909.	David Peoples	Completed Aug. 15, 1910.
Sanitary Contract No. 45, Lateral Sewers, District No. 27.	Dec. 18, 1909.	David Peoples	Completed Aug. 8, 1910.
Storm Water Contract No. 7	June 2, 1909.	Wm. McCarthy & Co.	Completed Dec. 31, 1909.
Storm Water Contract No. 8	Sept. 11, 1909.	M. O'Herron & Co.	Completed Dec. 31, 1909.
Sanitary Contract No. 46, Power-house, Pump House and Land Conduits, Sewage Disposal Plant	Feb. 21, 1910.	Ryan & Reilly	Completed April 1, 1911.
Sanitary Contract No. 47, Underwater Discharge Conduits, Sewage Disposal Plant.	Mar. 10, 1910.	B. F. Sweeten & Son	Completed Dec. 2, 1911.
Sanitary Contract No. 48, Lateral Sewers, District 19-B	Feb. 28, 1910.	Irwin Brothers	Completed Oct. 15, 1910.
Sanitary Contract No. 49, Lateral Sewers, District No. 35	Feb. 28, 1910.	Irwin Brothers	Completed Aug. 12, 1910.
Sanitary Contract No. 50, Jones' Falls Interceptor, Sec. No. 2.	May 20, 1910.	United Engineering & Construction Co.	Completed May 18, 1911.
Sanitary Contract No. 51, Electrical and Mechanical Equipment, Sewage Disposal Plant.	May 21, 1910.	McCay Engineering Co.	Completed Feb. 20, 1912.

TABLE No. 2- -*Continued.*

STATEMENT OF CONTRACTS LET PRIOR TO 1913.

CONTRACT.	DATE OF CONTRACT.	NAME OF CONTRACTOR.	PROPORTION OF WORK COMPLETED DECEMBER 31, 1913.
Sanitary Contract No. 52, Lateral Sewers, District No. 19-A, etc.	June 9, 1910.	Wm. McCarthy & Co.	Completed June 16, 1911.
Sanitary Contract No. 53, Lateral Sewers, District No. 25, etc.	June 23, 1910.	D. V. Ault & Co.	Completed Jan. 16, 1911.
Sanitary Contract No. 54, Trunk Sewers, District No. 48*	July 28, 1910.	W. H. & C. F. Thompson	Completed Mar. 10, 1911.
Sanitary Contract No. 55, Lateral Sewers, District No. 14	Sept. 16, 1910.	B. F. Sweeten & Son	Completed April 12, 1911.
Sanitary Contract No. 56, Coal and Ash Conveying Plant, Sewage Pumping Station	Sept. 20, 1910.	Dietz Engineering Co.	Completed March 1, 1913.
Sanitary Contract No. 57, Lateral Sewers, District No. 34-A	Nov. 10, 1910.	Whiting-Middleton Construction Co.	Completed July 14, 1911.
Sanitary Contract No. 58, McMechen Street Interceptor	Nov. 23, 1910.	McCay Engineering Co.	Completed April 3, 1911.
Sanitary Contract No. 59, Electric Wiring, Sewage Pumping Station	Dec. 16, 1910.	Central Electric Co.	Completed June 26, 1912.
Storm Water Contract No. 9	Mar. 26, 1910.	David Peoples	Completed June 27, 1911.
Storm Water Contract No. 10.	June 29, 1910.	George F. Beavin	Completed Dec. 24, 1910.

---

*Completion of work originally included in Contract No. 41.

TABLE No. 2—*Continued.*

STATEMENT OF CONTRACTS LET PRIOR TO 1913.

CONTRACT.	DATE OF CONTRACT.	NAME OF CONTRACTOR.	PROPORTION OF WORK COMPLETED DECEMBER 31, 1913.
Sanitary Contract No. 60, Sewage Disposal Plant Laboratory Building	June 3, 1911.	D. M. Andrew Co.	Completed April 1, 1912.
Sanitary Contract No. 61, Lateral Sewers, District No. 40-C	Jan. 10, 1911.	B. F. Sweeten & Son	Completed Nov. 1, 1911.
Sanitary Contract No. 62, Pratt Street Trunk Sewer	Mar. 9, 1911.	McCay Engineering Co.	Completed Dec. 18, 1911.
Sanitary Contract No. 63, Lateral Sewers, District No. 15	Mar. 11, 1911.	Wm. McCarthy & Co.	Completed Nov. 2, 1911.
Sanitary Contract No. 64, Sewage Pumping Station, Waterpiping and Steam Heating	Mar. 6, 1911.	Wanner Steam and Hot Water Heating Co.	Completed Mar. 31, 1912.
Sanitary Contract No. 65, Sewage Disposal Plant, Sewage Screens			Bids rejected.
Sanitary Contract No. 66, Lateral Sewers, District No. 36-A	June 15, 1911.	B. F. Sweeten & Son	Completed Mar. 1, 1912.
Sanitary Contract No. 67, Sewage Pumping Station, Junction Sewer	June 8, 1911.	Martin J. Beach	Completed Dec. 30, 1911.
Sanitary Contract No 68, Sewage Disposal Plant, Nozzles for Sprinkling Filters	Aug. 21, 1911.	Merritt & Co.	Completed Jan. 10, 1912.

ANNUAL REPORT

OF THE

TOPOGRAPHICAL SURVEY COMMISSION

1797

To the Mayor and City Council of Baltimore for the
Fiscal Year Ended December 31, 1913

BALTIMORE
MEYER & THALHEIMER
CITY PRINTER

1914

MAYOR'S OFFICE,

BALTIMORE, March 7, 1914.

To the Honorable the Mayor and City Council of Baltimore.

GENTLEMEN—The Topographical Survey Commission respectfully begs to submit the following report of its Chief Engineer.

Very respectfully,

JAMES H. PRESTON, *Mayor,*
JAMES F. THRIFT, *Comptroller,*
RICHARD GWINN, *Register,*

Topographical Survey Commission.

REPORT OF THE

CHIEF ENGINEER

TO THE

TOPOGRAPHICAL SURVEY COMMISSION

FOR THE YEAR 1913

CITY OF BALTIMORE TOPOGRAPHICAL SURVEY

Baltimore, December 31, 1913.

To the

Hon. James H. Preston, *Mayor,*
Hon. James F. Thrift, *Comptroller,*
Hon. Richard Gwinn, *Register,*
Topographical Survey Commission.

Gentlemen—In submitting the annual report of this Department for the year 1913, the data will be restricted more to the actual work embraced during the period, together with some recommendations for future improvements. During the past three years, especially, it has been the policy of the Department to dwell at some length on matters slightly beyond the narrower scope of its duties; or, in other words, in discussing various civic improvements, the reports have diverged from the purely elementary character of the problems, and the effort was made to discuss them from the standpoint of the broader principles of city planning involved. But during the past year our efforts were devoted to the greater extent to work which has been mentioned before in those reports, so for that reason the following comment will be limited.

The past year has been a busy one, and in reviewing the accomplishments we feel there is good reason for gratification. Quite an amount of new work has been evolved, some of it carried to its conclusion; but, mostly, the Department's efforts have been devoted to the carrying out of plans promoted during the past two years.

Streets in Connection with the State Roads Commission's Fund.

Following the policy adopted a few years ago, the Survey has continued during the past year to exercise supervision over the work done by the State Roads Commission within the city. This supervision consists mainly in arranging a cooperation between the Commission, the various city departments and the public service corporations having construction work in the beds of the roads being improved. The plan has worked well, and, we believe, to the general satisfaction of all concerned. Our associations with the Commission, its chief engineer and its other representatives have been most harmonious—indeed, cordial—and our every request has received prompt compliance.

Falls Road, Harford Road and Garrison Avenue.

Previous to this year the above roads were completed. There is, however, a short stretch on Garrison avenue (or rather its diversion northwesterly), Berwin avenue and a portion of Liberty Heights avenue which are not yet improved. This is due to a disagreement between the city and certain property-owners regarding the sewerage question. It is very unfortunate that such a matter should delay a condition badly in need of remedy. However, all possible paving is now going on, subject to the final adjustment of this question.

Frederick Road.

Work has progressed very satisfactorily on this road, and the end of the year finds the paving and the curbing almost completed. This is the case with the entire length, with the exception of the short stretches at the crossing of the two bridges—at Gwynn's Run and at Gwynn's Falls. The former only needs a few finishing touches to complete it, and the Gwynn's Falls Bridge, which is quite a long and elaborat one, is about 60 per cent. completed, and with workabl weather, and barring contingencies, the road should be entirely completed before summer. The paving and curbing now finished embrace a length of 1.5 miles, with 1,000 feet yet to be done.

Reisterstown Road.

This has probably been the biggest work undertaken by the State Roads Commission for the city. The road was widened quite a good bit, and this necessitated many delays in securing the land required. Practically all of the city constructional departments and the public service corporations had extensive and costly operations in the bed of the road, and it required constant attention to work out an harmonious plan of action.

From Liberty Heights avenue to the Pimlico Circle all of the underground work is finished; and along Brown's Hill, south from Liberty Heights avenue, all arrangements have been made for the subway work, and this section, too, should be completed very shortly.

The grading, except a few minor smoothing-ups, is completed through the length, except, however, the more than half of the Pimlico Circle which the Commission will improve in connection with the road; but this is comparatively a small job and will take only a short time. In all, 87,300 cubic yards of earth have been removed throughout a length of just about a mile.

A portion of the paving between Liberty Heights avenue and the Circle has been laid and the car tracks have been removed to the center on a private right-of-way which they will occupy along this stretch. But paving, for the time being, has been suspended on account of the risk of poor work during cold weather.

Liberty Heights Avenue.

This old road is, potentially, one of great service. It is a diagonal one leading from a well-developed section—Forest

Park, West Arlington and neighboring communities—to what will, when it is completed, be one of our greatest arteries of travel in the city—the Reisterstown road. But, due to its lack of paving, its grade crossing at the Western Maryland Railroad, but still more to its prohibitive grades as now exist, it has been for years almost a deserted way.

The plans for the betterment of Liberty Heights avenue are quite comprehensive, but as they have all been discussed and described in previous reports of this Department they will be omitted here. It has taken quite a good bit of maneuvering and discussion to obtain the extra strips needed for the adopted plans for the widening of this road; but, we are happy to say, this has finally been accomplished, the advertisement for the grading has been published and the bids will be opened on January 26. So, within a year, surely, the city should possess another wide, adequate thoroughfare.

Hanover, Cromwell and Light Streets.

The above streets form the approaches to Light Street Bridge—an highly important entrance to the city. They were all improved in part by the Commission. Hanover street was paved from Cromwell street to Cross street; Cromwell street, from Hanover street to Light street; and Light street, from Cromwell street to the bridge. The Hanover street paving extended a little over a mile, and the Light street paving just about a half a mile, making a total amount of paving for those three streets in South Baltimore of about 1.7 miles. This whole section has been much improved by this paving, for it affords what was formerly lacking—a decent way from Anne Arundel county to the city. Of course, what will do still more to provide an adequate way along this route is the replacement of Light Street Bridge.

South Baltimore Improvement.

The Light Street Bridge is far from being the only needed improvement for South Baltimore. The street system, as a whole, is very bad; or, rather, there are not enough streets. The first section of Key Highway gave us a wedge, so to speak, from the north for the betterment of this section; and the second section, the surveys and plats for which were prepared by this Department during the year, gives us still further means for working out an adequate system of streets.

The whole area south of Lee street, between the Northwest and Middle Branches of the Patapsco River, was thoroughly studied two years ago and plats and quite a detailed report were submitted to the Commission on City Plan by this Department. Since then the matter has been continually discussed; and, under instructions from his Honor, Mayor Preston, the City Engineer, the Harbor Engineer and the Chief Engineer of this Department, composing a committee, have submitted various recommendations. This committee has consulted with the engineers of the Baltimore and Ohio Railroad Company, which proposes to build a new freight line and very extensive additions to its yards on Locust Point, and with Mr. Collin McLean, who owns considerable property on the south shore of the Point and who has under consideration the building of large piers.

The first move to be made as a result of the committee's study of the situation, and following instructions from his Honor, Mayor Preston, is for the opening of a street from a point near the southeastern end of Fort avenue, southwesterly at right angles to the avenue, to a point 1,400 feet from the proposed relocation of the pierhead line; thence northwesterly, parallel to the pierhead line, to a point just about south of the Baltimore and Ohio Railroad round-houses; from this point a bend is made to meet the extension of McComas street easterly from Light street.

Also, in connection with the same opening, it is proposed to extend Woodall (formerly Allen) street to meet Key Highway to the north and to join in with the waterfront street, just mentioned, on the south. These openings, it is felt, will be of great importance to South Baltimore, for they will determine, to a marked extent, all future development of the section. Surveys are now being made by this Department for these openings, and early during the coming year the plats will be completed and filed and the ordinances introduced.

MILLS ROAD.

Of the entirely new highways planned for the future, plats and descriptions drawn and ordinance passed during the past year, Mills road is probably of greatest importance. It was fully described in last year's report under the head of "Hampden-Woodberry Connection." And that, in brief, is what it is, for it begins at Chestnut avenue and Thirty-third street (formerly First avenue) in Hampden and, by a curvilinear route, reaches the heart of the Woodberry section at Woodberry and Railroad avenues. These two sections are almost isolated from each other, and Mills road, besides giving an excellent connection between them and also to the center of the city, will promote development along desirable lines.

VARIOUS IMPORTANT STREET OPENINGS.

Grouped under the above caption it is difficult to say which streets should be given precedence; each has its own particular sphere of usefulness. The opening and widening of Aisquith street by a diversion around McKim School, the preservation of this historic and classic structure, and the general rearrangement of the car tracks in this immediate neighborhood by their removal entirely from Fayette street; this is all in class by itself, so to speak, and was all accomplished during the past year.

Ellicott Driveway.

The acquiring of the Westcott property fronting on Frederick road and extending back along Gwynn's Falls nearly to Edmondson avenue, not only aided greatly the construction of the Frederick Road Bridge over the Falls, but it also secured the major portion of the right-of-way, for an outlet from Gwynn's Falls Park at Franklin road southerly to Frederick road. All of the property needed has not yet been acquired, nor have the final plans been completed for this latter project, but the movement is well advanced and the coming year should witness its completion. The following report describes, somewhat in detail, the route, its advantages and its relationship to the contiguous territory; it is as follows:

BALTIMORE, MD., April 4, 1913.

HON. JAMES H. PRESTON,

Mayor of Baltimore, City Hall, City.

DEAR SIR—In conformity with your verbal request made some time ago, I beg to submit herewith my recommendations, together with a map, for the contemplated driveway between Frederick road, Franklin road and Gwynn's Falls Park.

The driveway throughout most of its length, which is a little over a mile, follows very closely the bed of the old mill-race. Over three-quarters of the required right-of-way is now owned by the city; it having been acquired by the city with the purchase of the Westcott property (outlined in brown on the map). This right-of-way ends at the dam just south of Edmondson avenue, and from this point northward a narrow strip, not exceeding forty feet, will have to be acquired from four different property-owners.

Between the dam and Edmondson avenue the property is owned by the Western Cemetery; and, although it would probably be useless to try to condemn the roadway through it, it is strongly felt that the owners of the cemetery would have no objection to the presence of the road, and it is very likely that satisfactory arrangements could be made.

The proposed route carries the road under the Edmondson Avenue Bridge, through an arch already provided for it, and then winds around the foot of a rocky hillside through the Shipley and Vickers properties, on the latter of which a diversion is made and the driveways extend in two directions—one road winds around to the eastward to meet the intersection of Lanvale street, Longwood street (formerly Eighth street) and Franklin road; this is the high elevation road and it is to serve as an outlet to the eastward along Lanvale street and to Edmondson avenue, via Longwood street or Franklin road.

The land just north of the Edmondson Avenue Bridge is of rugged character, wooded with a very good grove of trees, and would afford a very picturesque park bordering on Gwynn's Falls. So, in connection with the acquiring of the strip needed for the roadway, it is suggested to make the width excessive along this portion, so as to permit of a small park bounded by Edmondson avenue, Rosedale street (formerly Ninth street) and its connection easterly to Longwood street and the proposed driveway. This land, owing to its steepness, is practically incapable of being developed for building purposes, and if it can be purchased at a reasonable amount it would certainly add greatly to the attractiveness of the driveway. This land is outlined on the map in a faint green; the present park holdings are outlined in a deeper green.

The other branching road runs northerly to meet Franklin road at the intersection of the proposed extension of Mosher street; this is the direct connection, via Franklin road, to Gwynn's Falls Park. It is a low elevation road on an easy grade and would form an important connection not only with the park, but, by Franklin road, to the Patapsco River, and by other roads, connecting with Franklin road, far into Baltimore county. In this connection, it might be well to stat that a plat is now being prepared by this Department for the extension of Mosher street, from Payson street to Franklin road; this i to serve, besides street purposes, as an outlet from Gwynn's Falls Park to the eastward.

To the south the main driveway would connect with Frederick road and thence to the westward with Brunswick street and on into the important thoroughfare of Wilkens avenue.

Also (but this is a future possibility, if not a probability) the pr posed driveway is designed to connect with the extension of Balt more street west of Garrison avenue, as now in process of condemnation and shown on the plat. Should Baltimore street be constructe in the future it would form an important connection with the driv way; but, aside from this, the location of the driveway is such as make it a very useful thoroughfare, as well as an attractive park driveway, and it would certainly be of marked value in aiding transportation in this comparatively isolated section of the city.

The right-of-way of the Western Maryland Tidewater Railroad is shown on the map outlined in pink; and it can readily be seen that the railroad will interfere in no way with the proposed driveway. On the other hand, the railroad company, in acquiring its right-of-way through this section of the city, in many instances bought more land than it actually needed for constructional purposes and it now lies vacant. Many of these small parcels could be well utilized by the city in adding to the attractiveness of the driveway and Gwynn's Falls Park, and those that are deemed worthy for this purpose, as well as a few other scattered parcels, are shown in light green on the map.

On portions of the driveway it is proposed to widen it out in places, affording good views for outlook, where vehicles could stop without blocking the main driveway. But this detail, as well as many others, is not shown on the map, which is intended merely for a preliminary study.

Very respectfully,

(Signed) Jos. W. Shirley,

Chief Engineer.

The extension of Mosher street, from Payson street to Franklin road, will afford a connection to Gwynn's Falls Park from the east; and, although the plans which were prepared and filed are now being modified to curtail the expense of the condemnation, the plat and description should both be finished early in January.

The Alameda, the final link in the connection all the way from Druid Hill Park to Clifton Park, was adopted during the past year on a compromise plan; and, although not what we desired in alinement, it will, nevertheless, afford a very desirable improvement.

Upon the request of the Commissioners for Opening Streets, the Department prepared the opening and widening plat for Starr lane (formerly Old York road), from Gorsuch avenue to the northern boundary of the city. It is the intention to pave this road during the coming year; and, on the widened basis, this should satisfy a long-felt want.

Aside from the foregoing, and the projects mentioned under special headings, the following is a list of the more important plats which were prepared during the past year. This list does not include many location plats and work in connection with them, which were furnished to practically all the departments of public improvements. The list is as follows:

Plat for the opening of Spring Garden avenue, from Hanover street to Light street.

Plat for the opening of Linwood avenue, from Boston street to the waters of the Patapsco River.

Plat for the opening of Wyanoke avenue, from Greenmount avenue to Pen Lucy avenue.

Plat for the opening of Wicomico street, from Bush street to Stockholm street.

Plat for the opening of Hamburg street, from Bush street to Stockholm street.

Plat for the opening of a street, 66 feet wide, from Brunswick street to Frederick avenue.

Preliminary plat for the opening of Monastery avenue, from Frederick road to Old Frederick road.

Preliminary plat for the opening of Walbrook avenue, from Fulton avenue to Pennsylvania avenue.

Preliminary plat for the opening of Morling avenue, westerly from Falls road.

Preliminary plat for the opening of Woodland avenue, from Garrison avenue to Wolcott avenue.

Preliminary plat for the opening of Baltimore street, from Garrison lane to property of Mayor and City Council of Baltimore.

Plat for the widening of Ostend street, from Howard street to Plum alley.

Plat for the widening of Centre street, from St. Paul street to Davis street.

Plat for the widening of Brunswick street, from Lehman street t Frederick road.

Preliminary plat for the widening of Broadway by the condemnation of a lot of ground at the southwest corner of Broadway and Thame street.

Preliminary plat for the widening of Cross street, from Howard street to Plum alley.

Preliminary plat for the opening and widening of Courtland street, from Franklin street to Centre street.

Preliminary plat for the opening and widening of Traction street, from Pennsylvania avenue to Woodbrook avenue.

Preliminary plat for the opening and widening of Covington street, from Fifth lane to Gittings street.

Preliminary plat for the opening and widening of Dellwood avenue, westerly from Falls road.

Preliminary plat for the opening and widening of Walrad street, from Collins street to Loudon avenue.

Preliminary plat for the condemnation and widening of Elgin avenue, from Reisterstown road to Pulaski street.

Preliminary plat for the closing of a portion of Nursery alley, in the vicinity of Preston street.

Preliminary plat for the closing of several portions of Harford road.

Plat showing amendment to the general plan of streets, as adopted by Ordinance No. 129, approved December 3, 1898.

Plat of Old Marine Hospital tract and adjoining property to the west thereof, to determine the proposed division line between the Mayor and City Council of Baltimore and William H. Wagner, trustee (platted from deeds and old plats).

Topography map around a portion of northwest section of Bay View (contour interval, one foot).

NEW MAP OF CITY.

A special appropriation was made during the early part of 1913 for compiling a complete map of the city on the scale of 500 feet to one inch. This proved a more tedious project than was first expected, and the map was not completed until December. Various methods are being investigated for its publication, and some arrangement will be decided upon very soon, so that it will be ready for distribution early in the new year.

The map, while drawn to an accurate scale, will prove of more use for index purposes and for general consulting of street locations than for purely engineering purposes. It is expected to satisfy a long-felt demand in most of the departments, and it will, of course, save the departments a great deal of duplicate work.

Green Spring Parkway and Woodberry Avenue.

These two streets are closely related, especially near their junction with the Pimlico Circle. The troubles with the Green Spring Parkway have been numerous, nor are they yet over. Woodberry avenue is the only connection from a large neighborhood centering around this location to Woodberry and Hampden, and with the event of the parkway and the grading of the Circle the difficulty of making this avenue a serviceable one will be greatly increased. We have had the matter under most careful consideration during the whole of the year, and we still hope to be able to work out a method whereby both roads may be constructed along proper lines.

Gwynn's Falls Parkway.

This important boulevard connection received during the year an impetus which would seem, from all indications, to make it an actuality. There may, of course, be other serious obstructions to be overcome, but the outlook would certainly seem bright. Relative to the whole subject, it might be of interest to quote here a report submitted by the Department during the past year; it is as follows:

September 4, 1913.

Hon. James H. Preston,

Mayor of Baltimore, City Hall, City.

Dear Sir—From a news item reporting Tuesday's meeting of the Board of Estimates we note that approval was given to the condemnation of Gwynn's Falls Parkway, and as this project is one in which we have taken a keen interest, having designed a major portion of it.

we wish to put ourselves on record as endorsing the move most enthusiastically from all points of view, especially in relation to the street plan.

We have followed the course of this condemnation from its origin, and we have on file much data referring to various stages of it, which may be of service to you.

Briefly, our idea of the proposition is that the right-of-way should, by all means, be obtained now. We feel there is no immediate need for the construction of the boulevard as a whole, but the day is not so far distant when this must take place, and we feel that it would be the grossest kind of an error to miss the opportunity to acquire the necessary property. The right-of-way can never be obtained at a lower figure, and from a most careful study of the entire neighboring section we are most strongly of the opinion that no other adequate connection of this character, even though on a greatly modified width, can be acquired and constructed at less expense.

The parkway will connect two of our finer and greater parks, equal, we believe, to the best in other cities, and we feel that it would be very unfortunate to abandon the most important link of our superb chain of parks and park connections. There already exist too many bad examples of this "penny-wise" policy, and it is high time we were taking heed of our costly lessons of the past.

In the twenty-fourth annual report of the City Parks Association of Philadelphia, Mr. Andrew Wright Crawford makes the following comment which, we think, is especially appropos to the Gwynn's Falls Parkway:

"The recourses of a city fortunately increase with its needs. Failure to appreciate the fact that the annual income from taxation will be larger and the annual addition to the borrowing capacity of the city will be greater with each succeeding year, is the reason why the larger and larger plans prepared annually appear to be exceeding the capacity of the city. Any plan to be carried out in twenty-five years, for which the present capacity of the city is sufficient, is to be judged, because of that fact alone, as probably inadequate, as providing for a result at the end of those twenty-five years that will, in all probability, be entirely too small for the then existing needs."

On page 36 of this Department's last annual report (a marked copy of which we are forwarding to you herewith) is given a quotation which we also think very appropriate to the condemnation of Gwynn's Falls Parkway. On pages 19, 20, 42 and 44 are also quotations which we think apt to the subject.

Summed up, the objections to the parkway seem to arise purely from the adjustment of the benefits and damages and not from the broader point of view as to the worthiness of the scheme as a whole. And should this be true our efforts should be to study this phase of the subject, rather than to abandon a large improvement for the future on that account. But this, we feel, is a matter that can be adjusted, and the acquiring of the right-of-way of this important highway should by no means be side-tracked for what certain property-owners now consider a hardship.

The parkway is a most striking example of the great difficulty the city experiences in preventing buildings from being erected in the beds of streets in process of condemnation. It is interesting to note that, in this instance, the number of houses that have been erected since the proceedings were started. In each case we have made all possible efforts to prevent such erections, but, unfortunately, in many cases we failed. In some cases, however, the builders did conform to the lines of the parkway, and where this was done we believe the owners would now be injured if the plans of the parkway were abandoned.

Very respectfully,

(Signed) Jos. W. Shirley,

Chief Engineer.

Central Business Section Street Conditions.

The movement for a good thoroughfare from the northern section of the city to the down-town section, along the route of St. Paul street, has received quite a bit of agitation of late, and, as you will recall, this Department has made various studies for its improvement. We feel that the Calvert street terminal project is one, the solution of which will have a marked bearing on the form of improvement best suited to St. Paul street; but, in view of conditions as they now exist, we feel that one proper step for the city to undertake would be for the elimination of the off-set at Saratoga street by th widening of St. Paul street northerly on the east side, and southerly on the west side. This would give a straight thoroughfare from Lexington street to Hamilton street, a little over 7 feet in width. By so doing, the property on the east side, running back to Courtland street, would be badly cut up; and this, it is suggested, be all acquired and the remnants be redivided and sold. Or, in other words, excess condemnation or some similar method whereby the same results may be accomplished be employed. This a is departure from old methods, but it is one that has received the approval of the most eminent authorities on civic development, and for the welfare of the city it is to be hoped that suitable ways and means may be found for its accomplishment.

Relative to the various projects mentioned under the above caption is submitted the following reports, which discuss somewhat in detail the problems involved. The first report discusses the corelationship between the betterment of the Calvert street terminal, the Fallsway and neighboring intersecting streets. It is as follows:

May 29, 1913.

Hon. James H. Preston,
Mayor of Baltimore, City Hall, City.

Dear Sir—At the conference held this morning between the city and the Pennsylvania Railroad Company the plans submitted disclosed a situation which we think of such importance, at this time, as to merit special consideration.

You will recall that the plans submitted call for the building of a viaduct over Madison street and the railroad trackages, extending from Calvert street to Constitution street. Should this scheme be considered advisable, which, in the development of the freight yards in this neighborhood, would certainly seem appropriate, we feel that the resultant condition relative to the Fallsway should, at this time, received marked attention.

We understand that the contract for the Fallsway viaduct has just been awarded; if, as now planned, the viaduct is to meet Madison street at its present grade there would result, unless changes be made, a marked difference in the elevation of the Fallsway and that of the suggested Madison street viaduct. We feel, then, that it is important that consideration be given the matter at this time, so that if it is thought well to have a connection between the Madison street viaduct and the Fallsway that such arrangements should be made very soon.

If it is deemed wise to have such a connection between the two viaducts (and this would seem very desirable in view of the importance of Madison street as a through east and west thoroughfare, affording good connections with other streets) arrangements could be made so as to raise the elevation of the Fallsway, from Eager street south, to bring it to the grade of the proposed Madison street viaduct.

In our original study of the Fallsway project, as requested by the Commission on City Plan, we gave the Madison street crossing special study and discussed and suggested that some arrangements be made (similar to the above) for doing away with the grade crossings at this important intersection. For we felt that, even though no new lines were then proposed by the railroad company, the yard system was inadequate and that it would eventually be necessary to make radical changes. But as our alinement for the Fallsway was not adopted by the commission this detail, of course, received little consideration. We feel now, however, in view of present conditions, that we should call your attention to this matter, for if it is deemed feasible to make such changes it will certainly be less expensive to make them now than at any time in the future.

Very respectfully,

(Signed) Jos. W. Shirley,

Chief Engineer.

The following report treats of St. Paul street, with a view of making it an adequate thoroughfare from the northern residential section to the central business section:

December 16, 1913.

Hon. James H. Preston,

Mayor of Baltimore, City Hall, City.

Dear Sir—In conformity with your instructions, we are submitting to you herewith our study for the treatment of St. Paul street, north of Lexington street.

The improvement of St. Paul street should, properly considered, embrace many attributes, chief among these being the disposition of the Calvert street terminal problem, and no comprehensive scheme for the street system in this section of the city can be properly planned with this important factor eliminated.

The viaduct suggested for the betterment of the crossing at Centre street seems a move in the right direction, but we are not prepared at this time to give it our endorsement. There are, of course, various ways of treating such a condition, and in this, too, are involved many highly important factors. We think it hardly wise to state at this time whether this viaduct should be a through one, along the center of St. Paul street, as has been suggested, or whether there should be two viaducts for the north and south travel, one on each side of the street, leaving the center near its present elevation for diversion of traffic seeking an outlet to Centre street. In such a treatment, St. Paul street must, of course, be widened. An important influence for the adoption of either plan should be the ultimate nature of the business occupying buildings facing on the street.

We feel that at present there is no crying need for either structure over Centre street, especially as the extension and widening of Courtland street is now in process of condemnation, and this should do a great deal to relieve the situation. It may be that when conditions demand further treatment, when we shall have better information relative to the disposition of the plans of the Pennsylvania Railroad, and we shall know better the nature and amount of the traffic to be handled, that a remedy can then be found other than building an expensive viaduct.

Centre street will certainly need to be widened in the future; and, in conjunction with this, if there is felt a need for the segregation of the traffic on St. Paul street and on Centre street, then a viaduct may be necessary. But we feel now that it is too early, considering the many factors involved, to plan a proper treatment. Should such segregation not be deemed necessary, the grade at the intersection, which is now bad, could certainly be improved by extending St. Paul street, from the south, northerly in a straight line to Centre street, and from this intersection northerly to provide for a diagonal street to meet St. Paul street again at Monument street. In other words, the bend in St. Paul street would be made to the north of Centre street, instead of to the south, as it now is.

Several plans could be enumerated for the betterment of the crossing at St. Paul and Centre streets, but we feel very strongly, as you mentioned in your letter of December 11 to the City Solicitor, that this matter can very well wait, for a while at least. We also coincide with your view that the widening of St. Paul street should be begun early.

It would certainly be most desirable to adopt the principles of excess condemnation in the widening of St. Paul street; that is, the effort should be made and the courts rule on the constitutionality of the proceedings. Chapter 166, page 583, Laws of Maryland, 1908, would seem, from the layman's point of view, to give the necessary power;

but if additional authority is needed we should certainly obtain it from the coming session of the General Assembly.

In the Kingsway of London, now so often referred to relative to improvements of large scope, "recoupment," or excess condemnation, was employed. To us the noteworthy feature of this project was not so much that authority was given and approved to recoup, by the means employed, the expenses of the undertaking, but rather the very successful manner in which it was done. It was a tremendous undertaking and, from what we have learned from reports, the indications are that the final cost to the tax-payers will be nothing, or certainly very little. A great deal can be said for such a scheme; also, probably, something against it, but we can feel that excess condemnation has received the enthusiastic approval of the highest authorities the world over on city planning, and the St. Paul street project is an almost ideal site on which to employ it.

Summed up, our recommendations, restricted in scope owing to lack of information needed for a more comprehensive scheme, are as follows:

We think the present east line of St. Paul street, between Lexington and Saratoga streets, should be extended in a straight line northerly to Hamilton street, and the present west line of St. Paul street, between Hamilton and Saratoga streets, should be extended in a straight line southerly to Lexington street. This would give St. Paul street, between the limits of Lexington and Hamilton streets, a width varying from 71 to about 73 feet—approximately the same width as Charles street, south of Fayette street. There should be no off-sets as is now the case, and without car lines this width should be ample for the requirements.

We think the land embraced in the area bounded by St. Paul, Saratoga, Courtland and Hamilton streets should all be acquired, and after the widening the lots readjusted to the demands and either sold or leased for long terms. The same principle should not, however, be employed on the west side of the street, south of Saratoga street. We think conditions here are such that the widening may take place piece-meal, so to speak, somewhat after the manner employed in Philadelphia in the widening of Chestnut and other streets. And with this end in view we think that suitable legislation should be obtained from the coming session of the Legislature. We have, some time ago, forwarded to the City Solicitor a report on our investigations of this particular form of street widening, and, we believe, have collected some interesting and valuable data concerning it.

In regard to the cost for the widening of St. Paul street, we have made only a cursory estimate. We find that the blocks suggested to be purchased in entirety, and to be sold for recoupment, included within St. Paul, Saratoga, Courtland and Hamilton streets, are assessed at $368,192 on the books of the Appeal Tax Court. In all probability the purchase price for the city would be greater, but this is, of course, a matter for real estate experts.

After the street is widened, as suggested, and lot lines obliterated, the depths of the new lots would be about 100 feet. Owing to the difference of elevation in the two fronts, St. Paul and Courtland streets, each lot would have a ground floor entrance from both streets—giving, virtually, two ground floors to each building. By this arrangement of through lots of suitable widths the property would certainly be greatly enhanced in value; just how much is, of course, also a matter for the real estate expert.

We have made no estimate for the widening on the west side of St. Paul street, between Lexington and Saratoga streets; for this reason we have suggested it to be widened by the new method of establishing a widened building line.

Very respectfully,

(Signed) Jos. W. Shirley,

Chief Engineer.

Previous to the submission of the above report on the improvement of St. Paul street, the Department prepared plats, together with descriptive matter, concerning a suggestion made by Mr. Robert Lee Gill, relative to the proposed extension of Courtland street, from Franklin street to Centre street. But as this matter dealt also, to a great exent, with the improvement of St. Paul street, it will not be reproduced here in its entirety, though the following extracts are given to bring out the mutual relationship of St. Paul, Courtland and Centre streets. The extracts are as follows:

"While the proposed extension of Courtland street and the provision for a triangular park in connection with it, as indicated by Mr. Gill, appears to be an admirable suggestion, I think the question is of such importance as to deserve consideration relative to a readjustment of other streets in this immediate vicinity. By far the most important of the streets having a bearing on the extension of any north and south thoroughfare in this neighborhood is Centre street. And, in order that we may get the best results in any rearrangement of the north and south streets, a close scrutiny should be given to this important cross street.

"Centre street is at present, and there is every reason to believe that it will remain, the only east and west street between Fayette street, in the down-town section, and Madison street, in the residential section, that is at all suitable for a thoroughfare. This is due, of course, to the excessive grades on the other streets.

"Traffic is increasing all the time on Centre street, and when the Fallsway is completed we have every reason to feel that the accretions will be greater. There is a movement now on foot to widen Centre street, from St. Paul street east to Davis street, to a width of 66 feet, to correspond with the width between Howard street and St. Paul street, and a plat is now being prepared by this Department at the request of City Councilman Jefferson D. Norris for carrying out the project.

"This widening of Centre street should give immediate relief to the congested portion, but ultimately the entire length of the street should be widened to at least 80 feet, in order to accommodate the great flow of traffic that will undoubtedly use it. The demand for this is not now pressing, but it is well to consider it in relation to any proposed changes of streets intersecting Centre street. When the time for such action arrives, the widening should take place on the south side. The grade of Centre street is not so good in portions, but it is almost out of the question to better it.

"Considering again Mr. Gill's suggestion, we feel that for the present it would be an excellent move to extend Courtland street, from Franklin street to Hamilton street, about on the line he suggests. And, also, to acquire the triangular lot bounded by St. Paul, Centre, Courtland and Hamilton streets so that, in the future, when the city deems it well to rearrange the intersections of St. Paul and Centre streets, it will not need to acquire additional property.

"It might be well to mention here that the portion of Courtland street extending from Hamilton street to Centre street, over which the Gardiner Dairy Company's stable is built, is a public street and may be properly used as a thoroughfare.

"In view of the importance of both St. Paul street and Centre street as thoroughfares, we feel that the problems discussed above deserve careful consideration, and that no move should be started without due consideration towards an ultimate proper arrangement for these streets.

"In regard to the suggested ultimate widening of Centre street to 80 feet, it would be well to consider if this could be done in the same way as was proposed for the St. Paul street widening; that is, by restricting the improvements to the proposed widening zone."

Saratoga Street Extension, Easterly to Charles Street.

During the year a suggestion was made to the city to extend Saratoga street in a straight line from its bend at Liberty street to Charles street. This Department submitted a detailed report on the project, in which the suggestion was not recommended. But as this matter has received very little discussion from the public, it is not thought of sufficient import to reproduce the comments. The report also dealt, however, with the matter of widening Saratoga street on the north side, between Liberty and Charles streets, and we deem this of sufficient worth to reproduce the following:

"In considering the street arrangements in this section, we might add that Saratoga street, in our opinion, is the one which greatly needs improvement. Its present width is too narrow to give to it the use that its location would justify; and, as a by-word, the ten-foot sidewalk in front of the old Y. M. C. A. Building has encroachments on it to the extent of five feet.

"Saratoga street, with the exception of the building just mentioned, could be widened on the north side at comparatively little expense; that is, in comparison to the cost of the suggested extension. From Cathedral street to the lot just east of Little Sharp street the buildings all set back, and the lots are of such size and shape that the widening would certainly do them little damage, and might possibly be of advantage by giving to most of them an increased frontage on a wide, attractive traffic street.

"The old Y. M. C. A. Building is not at all suitable for the location, and it surely will not be very long before it will be replaced by an adequate, modern building. Of course, to condemn the present building, or even to condemn the ground required in case it should be razed, would be expensive, but we feel in this matter that the assessments could very properly be extended over a goodly area, and the benefits to the lots on both sides of Saratoga street would be considerable.

"It would seem, then, a wise move on the part of the city to have prepared an ordinance, on the so-called Philadelphia plan, widening Saratoga street on the north side to a good, ample width—the exact amount of which can best be determined after a detailed survey of the property has been made. More than half of the property required in such a widening can be gotten without causing damage to buildings, and it would seem well to make an effort to obtain this strip before any improvements are made. And when the plans have matured for any changes in the Y. M. C. A. Building, the portion required from this lot could then be obtained. On the whole, the improvement should not be a costly one, and we feel that it is worthy of consideration."

City Planning Exhibition.

During the past few years the subject of city planning has received wide discussion and the approval of the best authorities on civic problems. To stimulate public interest, which is most desirable, exhibitions covering most all phases of municipal improvements have been held in several cities. Baltimore exhibited in Philadelphia and New York; and, although our displays were far from elaborate, and were gotten up under rather trying conditions at very little expense, they nevertheless attracted quite a good bit of attention from outsiders. Especially was this the case in New York, where the exhibition was under the joint auspices of the Board of Estimates and Apportionment and the Merchants' Association. Not only has the American City Bureau, which directed the exhibition, requested the material for a collection to be exhibited in many cities of the country, but several municipal magazines have reproduced the pictures and have published articles bearing on them. This is all very desirable notoriety.

The movement inaugurated during the year to have a permanent exhibition from the city departments is certainly a good one; and, for one, the Survey will certainly do all within its means to accomplish creditable results, and we feel that the coming year will see the movement well started.

Blue Print Sub-Department.

This Department has proven one of steadily-increasing value to the city, for each year it has been kept busier, with the result, of course, that more work has been turned out; and this, too, at rates greatly below those charged by private enterprises in the city. The result has been that the amount of $4,137.52 was collected from the departments and put in the city treasury. The rates charged were: Blue prints, 1½ cents per square foot; white prints, 2 cents per square foot; negatives, 3 cents per square foot; blue print linen, 6 cents per square foot.

At the end of the year, under authority from the Honorable Board of Estimates, a machine was installed for coating or sensitizing the paper to be used for prints. When one stops to consider that the Department will, in all probability, use between three and four tons of paper during the coming year, and that our estimate in saving is, as near as we can figure it, between 25 per cent. and 40 per cent. over the method of purchasing paper from outsiders, it can then be seen that the investment should certainly prove one of spending to save.

In closing, I wish to state that the entire operations of the Department during the past year have been run most satisfactorily and we shall begin the new year in fine shape to meet what may be demanded of us. The revision of the topographical map of the city, which is now much out of date in sections, is a special feature for 1914. But this is a project—and quite a large one, too—in a class by itself, and our arrangements are such that this work will be carried out with no relationship to the routine work of the Department.

In conclusion, I wish to express my appreciation for the earnest and faithful performance of their duties of all associated with this Department.

Very respectfully,

Jos. W. Shirley,
Chief Engineer.

COMPLIMENTS

EZRA B. WHITMAN

PRESIDENT WATER BOARD
AND WATER ENGINEER

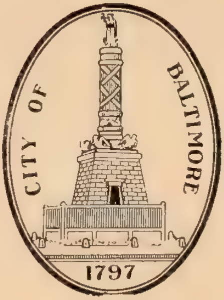
ANNUAL REPORT OF THE
WATER BOARD

TO THE

MAYOR AND CITY COUNCIL OF BALTIMORE

FOR THE FISCAL YEAR ENDING DECEMBER 31

1913



REPORT OF WATER BOARD
1913

Baltimore, January 1, 1914.

To the Honorable the Mayor and City Council of Baltimore.

Gentlemen—In compliance with the requirements of the City Charter, we beg herewith to submit for your consideration our report for the year 1913.

There were for the year two appropriations from the Water Department receipts, consisting of a salary appropriation of $106,920, and expense appropriation of $536,770, which was increased by $1,916.11 received for sales of old materials.

There were five appropriations from the tax levy: one of $93,000 for work in advance of improved paving (the Board of Estimates authorized this to be exceeded by $55,000 to be taken from the 1914 appropriation), one of $10,500 for Auxiliary Pumping Station, Lake Ashburton; one of $15,000 for cleaning mains in advance of filtration; one of $5,000 for pitometer survey for underground leaks, and one of $31,700 for repairs to pumping stations.

There were five appropriations from the 1958 Loan of $5,000,000: one of $75,860 for salaries for the Gunpowder Supply Improvement Division, one of $37,900 for salaries for the Filtration Division, one of $2,497,000 for the extension of the water system under the Act, one of $5,048.43 for construction of reservoir (balance from 1912), and one of $112,059.97 for new pumps, etc., Mount Royal Pumping Station (brought forward from 1912).

The appropriations and expenditures from them were as follows:

Expense (Department Receipts).

Appropriation	$536,770 00
Sales of old materials, etc	1,916 11
	$538,686 11
Expenditures	538,394 16
Balance	$291 95

Salaries (Department Receipts).

Appropriation	$106,920 00
Expenditures	101,293 47
Balance	$5,626 53

Work in Advance of Improved Paving (Tax Levy).

Appropriation	$93,000 00
Expenditures	147,832 01
Debit to be carried to 1914	$54,832 01

Auxiliary Pumping Station, Lake Ashburton (Tax Levy).

Appropriation	$10,500 00
Expenditures	....

Cleaning Mains in Advance of Filtration (Tax Levy).

Appropriation	$15,000 00
Expenditures	401 47
Balance	$14,598 53

Pitometer Survey (Tax Levy).

Appropriation	$5,000 00
Expenditures	5,000 00

Repairing Pumping Stations (Tax Levy).

Appropriation	$31,700 00
Expenditures	3,977 89
Balance	$27,722 11

Gunpowder Supply Improvement Division Salaries (1958 Loan).

Appropriation	$75,860 00
Expenditures	48,918 45
Balance	$26,941 55

Filtration Division Salaries (1958 Loan).

Appropriation	$37,900 00
Expenditures	21,145 16
Balance	$16,754 84

Extension of Water System Under the Act (1958 Loan).

Appropriation	$2,497,000 00
Expenditures	817,309 84
Balance	$1,679,690 16

CONSTRUCTION OF RESERVOIR (1958 Loan).

Appropriation	$5,048 43
Expenditures	....

NEW PUMPS, MT. ROYAL PUMPING STATION (1958 Loan).

Appropriation	$112,059 97
Expenditures	81,447 21
Balance	$30,612 76

The balances from the appropriations taken from the Department receipts are returned to the general treasury. The balances from the tax levy are carried over into the year 1914 for completing the work for which the appropriations were made.

The unexpended balances from the 1958 Loan revert to the loan funds and will be applied to the completion of the work already started and the future appropriation for general improvements of the water supply.

The total receipts of the Department and the disbursements are shown on the following tables:

RECEIPTS.

Amount received from water rents	$831,553 82	
Less returned	3,958 43	
		$827.595 39
Meter rents		569,669 69
Plumbing bills		72,492 41
Meter plumbing bills		7,099 52
Interest		1,899 89
Turn-offs		280 50
Vacancies		513 00
Sales of old materials, rents, etc		9,494 25
		$1.489.044 65

DISBURSEMENTS.

Water Engineer's Department:		
Expenses	$535,205 46	
Meters	1.272 59	
Salaries	101.293 47	
Collector of Water Rents and Licenses:		
Expenses	$2,034 43	
Interest	415,000 00	
Salaries	29,836 67	
Sinking funds	21,614 43	
		1.106,257 05
This shows an apparent surplus to be turned into the City Treasury of		$382.787 60

This, however, is not a true surplus of the receipts of the Department over the expenses of the city government in maintaining the Water Department, as there was $155,200 taken from the tax levy for work in advance of improved paving, for building auxiliary pumping station at Lake Ashburton, for cleaning mains in advance of filtration, for the work of the pitometer survey for underground leaks, and for repairs to the old pumps. There was also $184,534.01 taken from the tax receipts in order to pay the interest and the sinking funds of the 1916, 1922, 1926, 1943 and 1958 Loans made by the city for the improvement of the water supply.

The difference between the surplus above given and the money taken from the tax levy leaves a real surplus of $43,053.59. This is the actual amount of money received by the city from the revenues of the Water Department over and above all the expenses to which the city has been put in maintaining the Water Department.

In 1912 this surplus was $129,870.52, the decrease being due to more extensive work that was done during 1913 and paid for from the tax levy than was the case in 1912. Attention is again called to the fact that this surplus at the present time will probably be greatly reduced or entirely eliminated by the cost of operating the Filtration Plant after this is built and placed in operation.

As was the case during 1912, the general expenses of maintaining the Water Department during 1913 were much higher than would ordinarily be the case, owing to the amount of work being done in the city by the Paving Commission and the Sewerage Commission. Although there was a special appropriation to cover the work done in advance of improved paving there was a great deal of incidental work done by the Water Department in connection with the paving which is not charged to the appropriation. The work done by the Department for the Sewerage Commission and the sewerage contractors has also been very extensive and shows in the receipts of the Department under the heading of "Plumbing Bills," which this year amounted to $72,402.41, while in 1910 these plumbing bills amounted to only $42,067.01, and in 1912 to $51,010.76.

The exact amount of money spent from the 1958 Loan up to December 31, 1913, is shown in the following table:

Purchase of land		$369.543 71
Furniture and fixtures		1,187 04
Rent		5,056 51
Expert service		34.928 98

New pumps, etc., Mt. Royal Pumping Station	169.387 24	
Completion of Lake Ashburton	175.401 97	
Concrete pipes	1,776 00	
		411.473 35
		$1.980,888 21

The work under the charge of the various divisions of the Water Department for the year 1913 is outlined in the following pages:

ENGINEERING DIVISION

During the year this Division carried out its usual work of preparing plans for all work done by the Construction and Mechanical Divisions, preparing plans and specifications and supervising work done for the Department by contractors and making usual tests and inspections.

The plans for mains included 90,812 feet of mains, varying in size from four inches in diameter to 48 inches in diameter, which is a total of approximately 17 2-10 miles. This is an increase of approximately 33 per cent. over the amount of main laid during the year 1912. The largest of the mains that were laid was the 48-inch Middle Service main in Ensor street, which was started in 1912 and completed in 1913. Another important change was in connection with the discharge mains from the Mount Royal Pumping Station. This work is being done in connection with the new pump installed in this station and will make it possible to pump water from this station either through North avenue, as originally connected, or by a system of mains leading from the pumping station by means of a 36-inch main in Malster avenue and Mosher street, where a connection was made to a 36-inch main at Mosher street and Park avenue. The old discharge line connecting to the mains in North avenue is also being relaid. Owing to the heavy demand for water on the High Service, it was not deemed advisable to make this change during the summer months. The work on this new discharge main was begun on September 1, and is now well under way.

The location of the new discharge mains leading from Mount Royal Pumping Station and the old ones are shown on the accompanying plans.

The work of installing the new pumping engine, boilers, etc., at the Mount Royal Pumping Station has been entirely completed by the Bethlehem Steel Company as provided for in their contract of August 31, 1911. This contract provided for furnishing, delivering and erecting complete, one thirty-million-gallon vertical triple expansion pumping engine, two batteries of two boilers each, the necessary steam piping for engines and boilers, and economizers for heating the feed water

Upon the completion of the Filtration Plant this engine will pump against a head of one hundred and sixty feet. To meet the present working conditions which requires the pumping of the water from the Low Service Reservoirs to the High Service Reservoirs against a net

WATER MAINS IN VICINITY OF MT. ROYAL PUMPING STATION

NOTE: HEAVY LINES DENOTE MAINS INSTALLED IN CONNECTION WITH NEW PUMPING ENGINE head of two hundred and twelve feet, there have been provided three additional plungers of such area that when the engine is working at its rated speed the work performed, as expressed in horsepower, will equal the work performed under the ultimate conditions of pumping thirty million gallons against a head of one hundred and sixty feet. Therefore, the pump as it is now operating against a higher head has a capacity of only twenty-two and one-half million gallons in twenty-four hours. Upon the completion of the Filtration Plant, when the water will be directed to the pumping stations at about the same elevation as the Middle Service, instead of from the Low Service, as at the present time, the plungers now being used will be changed to larger ones and then the capacity of the engine will be the thirty million gallons called for in the contract.

The specifications require that "The engine shall perform a duty of not less than one hundred and seventy-three million foot pounds for each one thousand pounds of commercially dry steam used by the engine and any auxiliary pumps supplied by the contractor and operated during the duty trial. Steam containing less than 1½ per cent. of entrained water, as determined by calorimeter measurements, shall be considered as commercially dry steam. In computing the duty, the work performed by the engine shall be based upon plunger displacement. The head for computing the duty shall be that shown by accurate pressure gauges attached to the suction and discharge mains at a point inside the engine-room. No allowance shall be made for friction of water in pumps or pipes between the gauges attached to the suction and discharge mains. In computing the duty, the total steam used, including that used by jackets, reheaters and auxiliary pumps, shall be charged to the engine. The duty trial shall be not less than twelve hours or more than twenty-four hours."

Tests for the capacity and duty of the engine were conducted jointly by the Engineering Division of the Water Department and a representative of the contractor, and the result of these tests are given in the following tabulations:

MT. ROYAL PUMPING STATION.

Twelve-Hour Duty Trial on Triple Expansion High Duty Vertical Pump No. 10, Manufactured by the Bethlehem Steel Company—Sept. 18, 1918.

Dimensions and Proportions.

High pressure cylinder:

Diameter of piston	28 inches.
Diameter of piston rod	6 inches.
Length of stroke	60 inches
Area, head end	615.754 sq. ins.
Net area, crank end	587.480 sq. ins.
Clearance, head end	434.87 cu. ins. (1.177 per cent)
Clearance, crank end	394.80 cu. ins. (1.120 per cent)

Intermediate cylinder:

Diameter of piston	54 inches.
Diameter of piston rod	6 inches.
Length of stroke	60 inches.
Area of head end	2,290.226 sq. ins.
Net area, crank end	2,261.952 sq. ins.
Clearance, head end	1,283.11 cu. ins. (0.934 per cent.)
Clearance, crank end	1,243.00 cu. ins. (0.916 per cent.)

Low pressure cylinder:

Diameter of piston	82 inches.
Diameter of piston rod	7 inches.
Length of stroke	60 inches.
Area of head end	5,281.030 sq.ins.
Net area, crank end	5,242.545 sq. ins.
Clearance, head end	846.14 cu. ins. (0.267 per cent.)
Clearance, crank end	788.93 cu. ins. (0.251 per cent.)

Water cylinders:

Diameter of plungers for 23,092,560 gallons per day	32⅜ inches.
Area of plunger	823.210 sq. ins.
Displacement, per cylinder per stroke	28.584 cu. ft.
Displacement, three cylinders of pump per stroke	85.752 cu. ft.
Capacity in gallons for 24 hours (212 ft. head)	23,092,560 U. S. gals.
Diameter of suction pipe	42 inches.
Diameter of discharge pipe	42 inches.
Type of condenser	Surface
Location of condenser	In suction pipe.

1.	Duration of test, from 10 A. M. to 10 P. M.	12 hours.
2.	Total number of strokes per engine	17,825

Average Pressures.

3.	Steam pressure at throttle	176.27 lbs. per sq. in.
4.	Steam pressure in first receiver	35.57 lbs. per sq. in.
5.	Steam pressure in second receiver	13.80 lbs. per sq. in. (absolute).
6.	Vacuum in inches of mercury, condenser	26.98 inches of mercury.
7.	Pressure, suction water	11.87 lbs. per sq. in.
8.	Pressure, discharge water	104.26 lbs. per sq. in.
9.	Pressure, net discharge	92.39 lbs. per sq. in.
10.	Net head, in feet	213.54 ft.

Average Temperatures.

11.	Steam at throttle	439.29° F.
12.	Steam, first receiver	285.80° F.
13.	Steam, second receiver	210.80° F.
14.	Condensed steam, air pump discharge, condenser	75.00° F.
15.	Condensed steam, L. P. jacket drain	86.60° F.
16.	Condensed steam, second receiver	86.70° F.
17.	Suction water	71.70° F.
18.	Degrees of superheat at throttle	61.29° F.

Steam Consumption.

19.	Total weight of condensed steam from air pump discharge	95,615.5 lbs.
20.	Total weight of condensed steam from jacket drains	12,308.0 lbs.
21.	Total steam supplied to pump	107,923.5 lbs.

Fuel.

22.	Total weight of coal fired	13.214.0 lbs.
23.	Average speed in R. P. M	24.757

Horsepower.

33.	Indicated W. H. P., L. P., water chamber	294.867 H. P.
34.	Total indicated W. H. P	890.643 H. P.
35.	Developed W. H. P., from weight and head	855.882 H. P.

Duty per 1,000 Pounds Steam, on Plunger Displacement.

36.	First hour of trial, 10 A. M. to 11 A. M.	189,250,000.0 ft. lbs.
37.	Second hour of trial, 11 A. M. to 12 M	183,702,500.0 ft. lbs.
38.	Third hour of trial, 12 M. to 1 P. M	190,030,000.0 ft. lbs.
39.	Fourth hour of trial, 1 P. M. to 2 P. M	191,777,500.0 ft. lbs.
40.	Fifth hour of trial, 2 P. M. to 3 P. M.	186,638,700.0 ft. lbs.
41.	Sixth hour of trial, 3 P. M. to 4 P. M.	179,237,600.0 ft. lbs.
42.	Seventh hour of trial, 4 P. M. to 5 P. M.	194,274,600.0 ft. lbs.
43.	Eighth hour of trial, 5 P. M. to 6 P. M.	189,053,000.0 ft. lbs.
44.	Ninth hour of trial, 6 P. M. to 7 P. M.	190,347,400.0 ft. lbs.
45.	Tenth hour of trial, 7 P. M. to 8 P. M	188,965,300.0 ft. lbs.
46.	Eleventh hour of trial, 8 P. M. to 9 P. M.	192,293,500.0 ft. lbs.
47.	Twelfth hour of trial, 9 P. M. to 10 P. M.	185,980,800.0 ft. lbs.
48.	Average duty during entire trial	188,427,800.0 ft. lbs.
49.	Duty per 100 lbs. of coal on plunger displacement.	153,895,500.0 ft. lbs
50.	Duty in ft. lbs. per one milion B. T. U	152,560,420.0 ft. lbs.
51.	Capacity of pump, gallons per 24 hours	22,868,000.0 gals.
52.	Steam per lb. of coal	8.167 lbs.
53.	Steam per I. H P. per hour	9.787 lbs.
54.	Steam per W. H. P. per hour	10.508 lbs.
55.	Coal per I. H. P. per hour	1.198 lbs.
56.	Coal per W. H. P. per hour	1.287 lbs.
57.	Gallons pumped per lb. of coal	865.29 gals.
58.	Ratio of expansion	26.167

Efficiencies.

59.	Efficiency of engine	96.92 per cent
60.	Thermal efficiency	19.61 per cent.
61.	Themodynamic efficiency	30.41 per cent.
62.	Efficiency of water cylinder	96.10 per cent.
63.	Combined efficiency of pump unit	93.14 per cent
64.	Combined engine and pump load	6.86 per cent.

The boilers furnished under the contract were horizontal water tube boilers and have a rated capacity of 200 horsepower each and each battery of two boilers was required by the specifications to furnish a quantity of steam at least 30 per cent. in excess of the actual requirements of the engine when working at its full load.

The boilers furnished were those manufactured by Babcock & Wilcox, and each one is provided with a superheater of the attached type, and is designed to raise the temperature of the steam at least 50 degrees Fahrenheit above the normal temperature of saturated steam at the working pressure at which the boilers are to operate, when the boilers are steaming at their full capacity.

Each boiler is equipped with mechanical stoker of the under-feed type, the stokers being furnished by the Taylor Stoker Company; this company also furnishing the appurtenances required to operate the stoker, including the blower and engines, air ducts, piping, regulating valves, etc.

These stokers are required to prevent the formation of smoke while burning bituminous coal at the rate of from 20 to 25 pounds per square foot of grate surface per hour. They are also required to burn effectually and economically sufficient coal to develop the full rated horsepower of the boilers and to force the same to 50 per cent. beyond their rated capacity if required.

A Green economizer was furnished with these boilers and it was required that the economizer shall have ample heating surface to increase the temperature of the feed water passing through it by at least 100 degrees Fahrenheit when the boilers are steaming at their full rated capacity.

The specifications require that the boilers shall be rated upon an equivalent evaporation of 34½ pounds of water per hour into dry steam from and at 212 degrees Fahrenheit, equal to one boiler horsepower. They also require that the boilers shall evaporate 10½ pounds of water per pound of coal, and be capable of carrying an overload of not less than 50 per cent.

Careful tests were made of the boilers and the following tabulations show the results of these tests.:

MT. ROYAL PUMPING STATION.

Twelve-Hour Evaporative Test on Babcock & Wilcox Water Tube Boiler No. 7481, Equipped With Taylor Gravity Underfeed Stoker—May 30, 1913. (Station Boiler No. 4.)

General Data.

Fuel	Run of mine. Orendt Vein bituminous coal
Kind of furnace	Taylor Gravity Underfeed Stoker.
Kind of draft	Forced
Method of starting and stopping test	Alternate A. S. M. E. 1899.
Method of measuring coal	Platform scales.
Method of measuring water	Platform scales.
Method of flue gas analysis	Orsat apparatus.
Date of trial	May 24, 1913.
1. Duration of trial	12 hours.

Dimensions and Proportions.

2.	Equivalent horizontal grate surface (furnace dimensions: 7 ft. 3 ins. long, 7 ft. 4 ins. wide)	53.167 sq. ft.
3.	Stoker area, exclusive of dump area (5 ft. 9 ins. long, 3 ft. 11 ins. wide)	22.521 sq. ft.
4.	Area of air opening in tuyeres	238.0 sq. ins.
5.	Ratio of tuyere opening to stoker area	13.63 :100
6.	Water heating surface	2,058.0 sq. ft.
7.	Ratio of water heating surface to stoker grate area	91.38 :1.00

Average Pressures.

8.	Steam pressure by gauge	171.96 lbs. per sq. in.
9.	Atmospheric pressure (mercurial barometer, 29.72 inches of mercury)	14.59 lbs. per sq. in.
10.	Absolute steam pressure	186.55 lbs. per sq. in.
11.	Draft pressure under grate (2.167 ins. of water)	11.146 lbs. per sq. ft.
12.	Draft pressure over fire (.0565 ins. of water)	.293 lbs. per sq. ft.
13.	Draft pressure, third pass (.107 ins. of water)	.555 lbs. per sq. ft.
14.	Draft pressure, flue breeching (.6425 ins. of water)	3.335 lbs. per sq. ft.

Average Temperatures.

15.	External air	67.0° F.
16.	Boiler room	75.3° F.
17.	Feed water at storage tank	65.7° F.
18.	Feed water entering boiler	66.2° F.
19.	Steam	453.0° F.
20.	Escaping flue gases at boiler breeching	514.0° F.

Fuel.

21.	Size	Mine run, crushed to 3 ins.
22.	Total weight of coal as fired	10,676 lbs.
23.	Percentage of moisture in coal	1.705 per cent.
24.	Total weight of dry coal as fired	10,494 lbs.
25.	Total weight of ash and refuse	1,580 lbs.
26.	Percentage of ash and refuse in dry coal	15.06 per cent.
27.	Total combustibles consumed	8,914 lbs.

MT. ROYAL PUMPING STATION.

Four-Hour Capacity Test on Babcock & Wilcox Water Tube Boiler No. 7481, Equipped With Taylor Gravity Underfeed Stoker—May 30, 1913.

(Station Boiler No. 4.)

General Data.

	Fuel	Run of mine, Orenda Vein bituminous coal.
	Kind of furnace	Taylor Gravity Underfeed Stoker.
	Kind of draft	Forced.
	Method of starting and stopping test	Alternate A. S. M. E. 1899.
	Method of measuring coal	Platform scales.
	Method of measuring water	Platform scales.
	Method of flue gas analysis	Orsat apparatus.
	Date of trial	May 24, 1913.
1.	Duration of trial	4 hours.

Dimensions and Proportions.

2.	Equivalent horizontal grate surface (furnace dimensions: 7 ft. 3 ins. long, 7 ft. 4 ins. wide)	53.167 sq. ft.
3.	Stoker area, exclusive of dump area (5 ft. 9 ins. long, 3 ft. 11 ins. wide)	22.521 sq. ft.
4.	Area of air openings in tuyeres	238.0 sq. ins.
5.	Ratio of tuyere opening to stoker area	13.63 :100
6.	Water-heating surface	2,058.0 sq. ft.
7.	Ratio of water-heating surface to stoker grate area	91.38 :1.00

Average Pressures.

8.	Steam pressure by gauge	175.53 lbs. per sq. in.
9.	Atmospheric pressure (mercurial barometer, 29.80 inches of mercury)	14.63 lbs. per sq. in.
10.	Absolute steam pressure	190.16 lbs. per sq. in.
11.	Draft pressure under grate (3.658 ins. of water)	18.713 lbs. per sq. in.
12.	Draft pressure over fire (.0465 ins. of water)	.241 lbs. per sq. ft.
13.	Draft pressure, third pass (.167 ins. of water)	.865 lbs. per sq. ft.
14.	Draft pressure, flue breeching (.6853 ins. of water)	3.548 lbs. per sq. ft.

Average Temperatures.

15.	External air	59.5° F.
16.	Boiler room	71.5° F.
17.	Feed water at storage tank	66.1° F.
18.	Feed water entering boiler	66.2° F.
19.	Steam	473.6° F.
20.	Escaping flue gases at boiler breeching	646.2° F.

Fuel.

21.	Size	Mine run, crushed to 3 ins.
22.	Total weight of coal as fired	6,603 lbs.
23.	Percentage of moisture in coal	1.795 per cent.
24.	Total weight of dry coal as fired	6,484 lbs.
25.	Total weight of ash and refuse	882 lbs.
26.	Percentage of ash and refuse in dry coal	13.6 per cent.
27.	Total combustibles consumed	5,602 lbs.

Average Proximate Analysis of Coal.

Both the engine and the boilers more than met the requirements of the specifications, as is shown more clearly in the report of Mr. Robert L. Clemmitt of the Engineering Division, and were accepted by the Board.

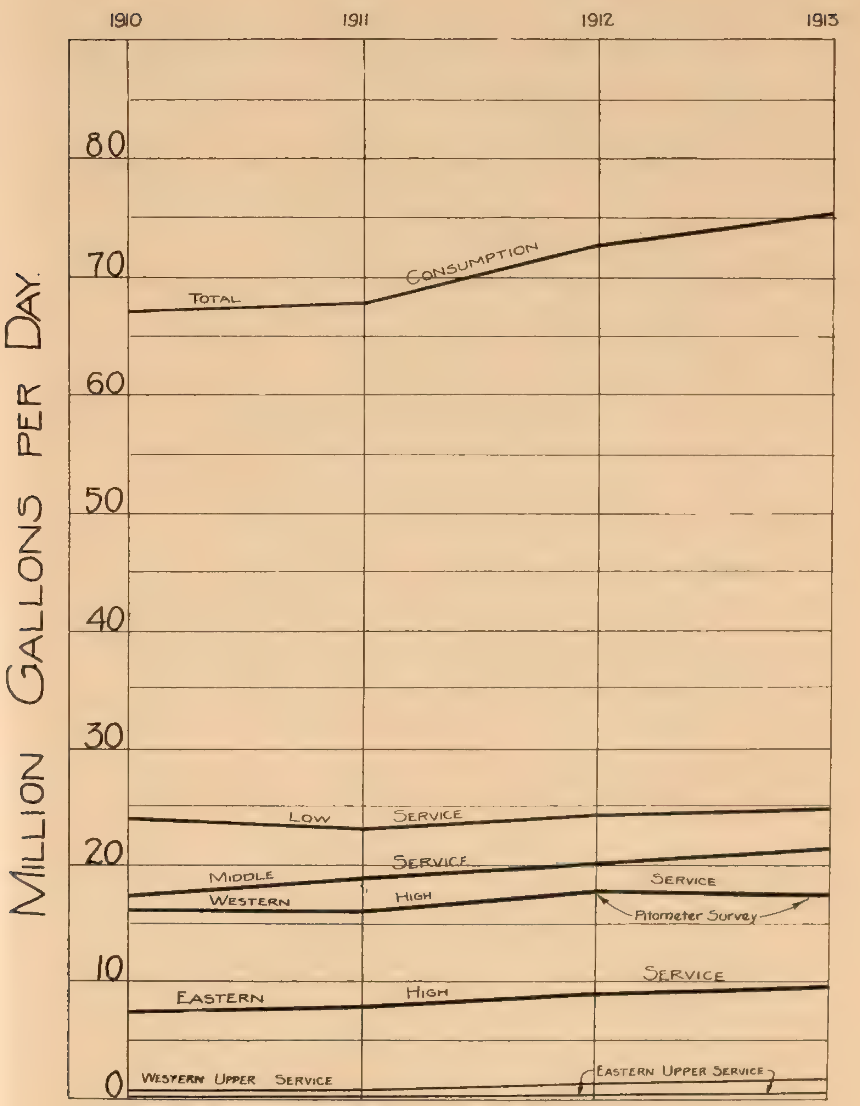
At the beginning of the year a survey was organized to ascertain by pitometer measurement the amount of underground leakage existing on mains and service pipes in the streets and on plumbing fixtures inside of the houses.

A description of the methods, results, costs and materials required for doing this work is given in the report of the Engineering Division.

Most of the work was carried out in the Western High Service District. The water consumption in this district was lower in this service than it was last year, although the Sewerage Commission has done a great deal of work in the Western High Service District and has used a considerable amount of water in construction, in puddling of trenches and for flushing the sewers when the construction was completed. All the other services showed a considerable increase over the water consumption for the year 1912, the Western High Service being the only one that shows a decrease.

The accompanying diagram shows the consumption of water on the different services and how these services increased with the exception of the Western High Service.

CONSUMPTION BY YEARS.



The survey in the district showed that the defective house fixtures are responsible for about 60 per cent. of the total leakage, and that broken supply pipes were responsible for about 20 per cent., while leaks from mains and valves in the street construction were responsible for the remaining 20 per cent. When this work is carried into the older part of the city with its older mains and service pipes, it is expected that the percentage of leakage on the mains and service pipes will be very much higher than in the newer section of the city, which was first examined.

The Pitometer Survey organization also carried out the work of cleaning the water mains that was done during the year. No attempt was made to do the cleaning by the use of any patent apparatus or methods, but it has been done by a method of flushing in alternate directions developed in this Department. While the cleaning of mains by this method is probably not as thorough as when a mechanical scraper is pulled through the mains, there is no question but that a great majority of the mud and dirt deposited in the mains can be removed by this method, especially on the smaller sizes of mains, and the cost is very small compared to other methods. The Department cleaned 40 31-100 miles of mains by this method at a total cost of $577.80.

CONSTRUCTION DIVISION

This Division has been engaged during the year in its usual work in the construction and repairs of all mains and piping owned and controlled by the Water Board, the connections thereto, the installation of house services, meters, fire hydrants, fountains and blowoffs.

This Division has had one of the busiest years in its history.

The following table shows how the work has increased during the past four years:

EXTENT AND CHARACTER OF INSTALLATION BY WATER DEPARTMENT.

Nature of Work.	Years.			
	1910.	1911.	1912.	1913.
Extension of mains:				
Length	67,886	87,808	68,824	97,293
Sizes	4″ to 48″	2″ to 30″	3″ to 16″	3″ to 48″
Cost	$128,908.37	$149,339.85	$81,220.07	$198,794.52
Flat rate services:				
Number	2,410	2,784	2,982	3,256
Cost	$22,466.66	$26,722.41	$29,590.86	$35,558.52
Meter services installed:				
Number	114	81	324	217
Sizes	⅝″ to 6″	⅝″ to 6″	⅝″ to 6″	⅝″ to 6″
Cost	$7,871.86	$6,822.41	$16,941.44	$15,012.79
Fire hydrants installed:				
Number	74	46	166	276
Cost	$6,910.13	$4,021.87	$13,125.07	$19,805.40
Repairing and changing mains:				
Cost	29,356.11	45,857.97	28,435.86	49,099.22
Repairing and transferring services:				
Cost	44,050.72	43,689.97	56,136.48	48,839.41
Repairing meters:				
Cost	10,057.97	5,968.17	7,463.59	7,862.60
Plumbing work:				
Cost	25,811.93	25,142.15	39,052.96	55,505.11

Much of this increased work has been due to the laying of mains and the changing of house services in advance of improved paving laid by the Paving Commission, Commissioners for Opening Streets and the State Roads Commission. A considerable amount of work has also been done for the Sewerage Commission. Owing to the fact that sewers cannot be laid with changes or breaks in the line or grade, wherever the water mains or house services are in the way of sewer construction, it is necessary to move them.

This Division has also made 575 taps to the mains for the purpose of carrying water to the flushing manholes at the upper or dead ends of the sewers. It has also had charge of the laying of the 30-inch, 36-inch and 48-inch pipe connections around the Mount Royal Pumping Station in connection with the installation of the new thirty-million-gallon pump at this station.

Owing to the large amount of contract work being carried on in the city by the Sewerage Commission, the Commissioners for Opening Streets, the Paving Commission and the State Roads Commission, it was very difficult to secure enough labor to carry out the work of this Division, and the efficiency of the labor which was available was not as high as it has been, which is shown in the increased cost of laying mains throughout the year.

MECHANICAL DIVISION

The work of the Mechanical Division includes the care and operation of the three pumping stations of the Water Department and of the machine shop at the Gay Street Yard, where all the fire hydrants used in the Department are made, as are also the gate valves up to sixteen inches in diameter.

At the Mount Royal Pumping Station, the new pumping engine and the boilers were turned over to the Mechanical Division after they had been tested and accepted by the Engineering Division. This new pump has been running very satisfactorily since it was placed in operation, but has not been run up to its full speed, owing to the construction work on the mains outside of the station.

A change was made in the organization of the operating forces at the pumping stations at the beginning of the year and the engineer on the day watch at each station was given the title of Engineer-in-Charge and is held responsible for not only what happens during his watch, but during the watches of the other engineers.

This placing of responsibility on one man has worked admirably and has relieved the Superintendent of the Mechanical Division of a great deal of routine work which otherwise fell upon him to do.

At the Mount Royal Pumping Station, most of the auxiliary machinery in the station has been overhauled, and when one of the 17,500,000 pumping units broke a piston in October, this pump was dismantled for the purpose of giving it a thorough overhauling.

At the Eastern Pumping Station, either one or both of the pumps have been in continuous operation throughout the entire year, with the exception of a period of approximately eight hours. A considerable amount of work has been done toward putting the two pumps at this station in better condition. This was done, however, without shutting down the plant and at the same time without dismantling either pump to such an extent that it could not have been put back into service within eight or nine hours in case of an emergency.

Owing to the fact that it had been necessary to keep the pumps at the Eastern Pumping Station in almost continuous operation while the piping around the Mount Royal Pumping Station was being changed in connection with the installation of the new pump, there had been little or no opportunity to make the proper repairs on the two pumps at the Eastern Pumping Station. Upon the completion of the installation of the new pump and starting it in regular operation, opportunity was found for making repairs to the two pumps at the Eastern Pumping Station.

One of these pumps, No. 1207, was found to have a slip of 32.7 per cent. The valves on this pump were all overhauled and the straight port seats in the pump were either renewed or faced off and put in first-class condition and practically all the hard rubber valves were renewed. This reduced the slip to 9 per cent., although in a short time it had increased again to 11.5 per cent. About the middle of August, Boyd turbine valves were bought and these were gradually installed to take the place of the straight port valves. With six of the eight decks equipped with the turbine valves, the slip was reduced to 3 per cent. Five weeks' run in this condition, however, had increased the slip to 7.4 per cent. The replacing of the two decks of straight port seats with turbine valves again reduced the slip to 4.8 per cent., and after running for about six weeks this slip had increased to 5.7 per cent.

It will be noted from the above, with the old straight port seats in the best of condition, the slip was 9 per cent., and in 10 days it had increased to 11.5 per cent., while with the turbine valves the slip was 4.8 per cent., and in four weeks' time the slip had increased only 0.9 per cent.

Another advantage noticed in the use of the turbine valves is that although the pump has operated 127 days of 24 hours each, there have been no broken turbine valves or valve springs, while with the straight port seats, broken valves and valve springs frequently made it necessary to stop the operations of the pumps to replace the broken parts.

The second pump at the Eastern Pumping Station, No. 839, was also in very poor condition, and the slip had increased to 24.4 per cent. before it could be put out of service for the thorough overhauling it needed. The valve seats were overhauled and as the straight port valves were taken from Pump No. 1207 they were placed in Pump No. 839. This overhauling of Pump No. 839 brought the slip down to 8 per cent. In three weeks' time this slip had increased to 10 per cent.

The use of the turbine valves has been justified by the results obtained and the points in favor of the turbine valves over the straight port valves are as follows:

First—The reduction in the slip of the pump below that which is possible to obtain with the straight port seats. The lowest slip obtained with the straight port seats in absolutely first-class condition was about 8 per cent., while the lowest slip obtained with the turbine valves was 3 per cent.

Second—The continued good results obtained by the turbine valves over a period of time; that is, the slip of the pump increases much more rapidly with the straight port seats than it does with the turbine valves.

Third—The valves and springs with the turbine valves do not receive the jar and shock which they get with the straight port seats, and they, therefore, do not break with the frequency which they do with the straight port seats. This is a very considerable advantage, as it becomes necessary to shut down the pump and open up the water end and replace the broken parts whenever a valve or valve spring is broken.

Fourth—The operation of the water end of the pump has been very much quieter with the turbine valves in use than it was with the straight port seats in use. This reduces the shock on the valve deck due to the slamming of the valves.

Fifth—The rotation of the turbine valves keeps the valve seats in good condition, free from the radial cuts which appear in the straight port valves which open and close without rotation, always dropping back in their initial position.

The full details of these tests are given in the accompanying report of the Superintendent of the Mechanical Division:

"Just prior to June 12, 1913, all of the straight port seats in Pump No. 1207 were either renewed or faced off and put in prime condition, at the same time practically all the hard rubber valves were renewed. During the process of overhauling the valves and valve seats, which took considerable time because the pump could not be dismantled and had to be left in such shape, so that it would take only a couple of hours to place it in condition ready for service, in case of break down on Pump No. 839. The justification of this procedure was borne out a number of times. Due to the intermittent use of Pump No. 1207, and from June 12, 1913, back to February 26, 1913, no slip test was made. On the latter date this had reached the amount of 32.7 per cent.

"The consumption of steam by the pump on June 12, 1913, and on the basis of water horsepower at discharge, and pumping at the rate 10,937,000 per day was 22½ pounds per water horsepower, this with the by-pass closed between the high pressure and intermediate pressure cylinders. On the same day with a delivery by pump displacement at the rate of 13,440,000 per day and by pitometer 11,219,000, the steam consumption was per water horsepower 24 1-10 pounds; this with the by-pass open between the high pressure and intermediate pressure cylinders, to obtain the requisite speed. During the progress of this test and after, there was an erratic action in the operation of the pump, the pump not being influenced by operating the cushion valves for quieting the valves of the water chamber. This led to an investigation of the reheaters connected with the steam end. Upon opening this up we found one tube split and another broken off. These were repaired, and from that time on we were enabled to better control the action of the pump. On June 23 a slip test was made with all valves and seats 'straight port' being in the best of condition. The slip was 10.06 per cent. On August 5 the slip indicated 9.04 per cent., and on August 15 it had increased to 11.5 per cent. The minimum slip having been reached as per test of August 5. Between August 15 and September 9 part of the straight port seats were replaced with turbine valve seats. On September 9 the slip indicate was 8.05 per cent. During this time and after, and up to February 25, 1914, the old straight port seats were gradually replaced by Boyd turbine valve seats. The minimum slip obtained was on December 10, when the pump indicated 3 per cent. On January 26, 1914, with two decks of the old straight port seats still in the pump, the slip had increased to 7.4 per cent. On February 27, after replacing the balance of the straight port seats with turbine valve seats, the slip test indicated 4.8 per cent. The slip at this writing is 5.7 per cent. One thing very noticeable with the turbine valve seats has been that the pump is very quiet in its water end, while heretofore it was always very noisy.

"From the above you will note that with the old straight port seats that the slip increased from 9.04 to 11.5 per cent. in a period of ten days, while with the turbine valve seats, from February 27 to date, there has been an approximate increase of 0.9 per cent. of one per cent. in the slip. From September 9, date of first test with part turbine valves to date, there has been experienced no trouble with the turbine valves, nor has the pump been shut down on that account, except that on three different occasions a seat worked loose from the deck. There have been no broken valves nor broken springs, the same, however, has been a frequent occurrence with valves and springs on straight port seats. From September 9 to date the pump has been actually in service for 24 hours per day and for 127 days. On this day Pump No. 1207 was cut out of service for the purpose of examining some of the seats and for the removal of valves and part of the Boyd Turbine arrangement, for examination and submission to you with this report. The three valves from Pump No. 1207 are as follows: A Dick cotton-duck valve and the soft rubber valve, both of which were in the test. The third or hard rubber valve, was one of the first installed about September 9. The soft rubber valve and the Dick cotton-duck valve were placed February 25. All three valves showed no signs of cutting except the hard rubber valve, and in that the cuts are circular, which would indicate plainly that the valve has been rotating—one of the principal features of the Boyd valves. On the other hand you will notice that the soft rubber valve has an imprint of the bridges, which bridges by the way are below the surface of the seats. It would indicate that the valve has not been turning and upon examination of back of the valve and the center hole apparently the valve has not been riding true. This might be occasioned by binding on the stem or being too neat a fit in the cup. The Dick cotton-duck valve and soft rubber valve were placed on February 25, 1914. Particularly noticeable on all the valves was the carrying of sand granules by the water. All turbine valve seats examined show a good face and entire absence of the trouble experienced with the straight port seats, i. e., no cutting. The turbine valves' stem and piston pockets, however, show the effects of wear, both due to the spring and the plunger at the top of the valve cup. This wear you will notice on a sample submitted. The indication is that the springs fit a little too tight and may be the cause of the condition as shown on the soft rubber valve. For comparison I send a second hard rubber valve from Pump No. 1207 that has been on the turbine seats, and then too a hard rubber valve and soft rubber valve and a cotton-duck valve from Pump No. 839. The No. 839 valves were placed December 9, 1913, on straight port seats with the bridges flush with the top of the seats. The soft rubber valves showed the entire imprint of the bridges with no rotary movement, and doubtless in a short time would be considerably bellied. The cotton-duck valve shows the imprint of the bridges also, but this valve had not apparently been seating in the same position continuously, for what reason I am unable to say. The hard rubber valve at this writing shows a good seat, and further, that it is just beginning to impress itself upon the bridges, which can be noticed by a close examination of the face.

"Pump No. 839, on November 13, with straight port seats, the slip had increased to 24.4 per cent., and as it was essential that there be something done therewith, the seats were overhauled and many were replaced by seats taken out of Pump No. 1207 at the time of installing turbine valves. The best condition of slip was obtained with all valves renewed and the seats in good condition on January 19, when it was 8 per cent. On February 10 this had increased to 10 per cent.

"It has been impracticable to make a test for steam consumption on account of weather conditions and the carrying of the condensate from the pumping station to the meter-room and across the lawn. Any reduction in the steam consumption, however, should not be credited entirely to the turbine valves, nor at the same time should they be credited with the total reduction in slip from 11 per cent. down, but I do not think they should be credited to all reduction in slip below 9 per cent., because with the straight port seats we are unable to approximately reach that condition only. The turbine valve seats are favored for making a perfect seal by the depressed bridges and covering the valve with a cup. The extremely important points in favor of the turbine valve seats, to me, are the reduction in slip; the continued low slip conditions; the absence of broken valves and springs, i. e., necessitating the shutting down of the pump and replacement; the quiet operation and lack of shocks on the valve deck, due to slamming valves, and last, but not least, that the valve seats with the turbine valves show a high polish, as against radial cutting, as on straight port seats, where the valves always drop back into their original position. The advantage of this can readily be appreciated when it is realized to reduce slip on straight port seats and obtain the best conditions, the seats too must be refaced in position which entails considerable work. The wear shown on the turbine valve parts is also, to some extent, offset in the case of straight port valve seat parts. Since writing above I have also had a turbine seat and straight port seat taken out and the difference in action on the seat is that the turbine is smooth and bright, while the straight port is considerably cut radially at the hub.

"In conclusion, I am unable to find any condition with the turbine valve which would warrant me to condemn them, as they have given good service, and they have a great deal to commend them."

An experimental mechanical stoker was installed under one of the boilers at the Eastern Pumping Station by its inventor, but up until the end of the year it had not proved satisfactory. It has been rebuilt, however, and it is hoped that it will eventually prove a success. If this mechanical stoker is successful, it will make it possible to install stokers of this description at a very much smaller cost than has been possible heretofore. One big advantage in the installation of this mechanical stoker, if successful, will be the practical elimination of the smoke from the chimney at this station.

At the Western Pumping Station the pumps and boilers have given little trouble during the year, but it was necessary to relay a considerable portion of the piping just outside of the station. A cross connection controlled by a six-inch valve was also made between the Eastern and Western Upper Services and by means of this connection it was possible to pump to both services with one pump.

In the 1912 appropriation, provision was made for an auxiliary pumping station at Lake Ashburton to help out the Western Pumping Station on the Western Upper Service. It was found possible, however, to utilize the pump to better advantage, owing to the abovementioned cross connection and a more careful study of the entire situation in conjunction with the proposed filtration work showed that this auxiliary pumping station would not be in a position to be used after the Filtration Plant is placed in operation, and water from covered reservoirs only will be used.

Messrs. Freeman & Stearns recommended that all water used by the city be kept in covered reservoirs, the present Middle and Low Services being fed from the new filtered water reservoirs at the Filtration Plant at Montebello, while the High Service would be fed from the Western High Service Reservoir in Druid Hill Park, which they recommended to be covered. Their investigation, however, did not cover the Upper Service District, fed from the stand pipes in West Arlington and Roland Park, the water from which is pumped from either Druid Lake or Hampden Lake, both of which reservoirs they recommend to be abandoned for ordinary uses.

As the Western Pumping Station, especially in connection with the summer consumption of water in the Western Upper Service, has about reached the limits of its pumping capacity, and as Druid Lake and Hampden Lake will be put out of commission after the completion of the Filtration Plant, rather than spend the money appropriated for the auxiliary pumping station at Lake Ashburton, it seemed wiser to hold this money and let it be applied toward the building of an upper service pumping station, taking suction from the covered Western High Service Reservoir in Druid Hill Park. Provisions have been made for building this new pumping station during the year 1914.

At the machine shop at Gay Street Yard the work done has been greatly in excess of that of any year in its history. This has been due to the large amount of mains laid during the year, the work of the Department due to the improved paving and the new sewers, the work on the new improvements provided for by the 1958 Loan, and the work of repairing and painting automobiles, not only for the Water Department, but for the various departments of the city government. The facilities for the repair of automobiles, however, are not very good, and a separate fire-proof building should be provided for this work.

COUNTY DIVISION

The County Division has charge of the various reservoirs owned by the city and the lands adjacent thereto, excepting where such lands are under the direct charge of the Park Department. The various reservoirs and their surroundings are in good order, with the exception of Lake Ashburton, the grounds adjoining which were turned over to the Park Department. The Park Department, however, has had no funds to spend on these grounds and they are in a very unsightly condition.

The work of purifying the water supply by the addition of alum and hypochlorite has also been carried out by the County Division during the year 1913. The plant for adding hypochlorite to the water was removed from Loch Raven to the Gate House at Lake Montebello about the end of 1912 and has been in operation during the entire year of 1913 at this point. It was expected that it would be possible to use a considerable less amount of hypochlorite on the effluent from Lake Montebello after the water had been treated with alum and settled clear. Acting upon this theory, the amount of available chlorine was reduced to eight-tenths part per million. This quantity was evidently not enough to kill the typhoid bacteria, as during the latter part of July and in August, the number of cases of typhoid fever in this city increased to a considerable extent over what it had been during the same periods during the year 1911 and 1912, as shown in the accompanying table giving the typhoid fever statistics for a number of years.

The quantity of available chlorine was increased to one part per million about the end of July and in the early part of August to one and one-half parts per million and later to two parts per million. This increased quantity of the chemical gave a practically sterile water and the number of typhoid fever cases decreased during September, and in October the number of cases was less than in the two preceding years.

This greatly increased amount of hypochlorite which it was necessary to add to the water supply produced a decidedly unpleasant odor, and analyses showed that there was free chlorine in the water. The quantity of chlorine was reduced as cold weather approached, and the experience of the Department would clearly indicate that the quantity of chlorine should be varied according to the season of the year when it is used.

In the summer time when the water is warmer and the pollution is probably more pronounced than in the winter time the quantity of hypochlorite added to the water should be increased. With the approach of cold weather this quantity can be reduced, but with the approach of warm weather in the spring this quantity should be increased with the maximum in June and during the summer months of July, August and September.

The treatment of the water supply with alum for the purpose of clarifying it was carried out during the year, but it was found that a considerable less quantity of alum could be used than was used in the beginning of this treatment The quantity of alum used at the start in 1912 was based upon the experience in Washington. It was found, however, that with the long storage period available in Montebello, considerably smaller quantities of alum could be used and good results still be obtained, and the expense of treating the water with alum was almost cut in two as the result of making a careful study of local conditions.

The results obtained by the treatment of the water supply by both the hypochlorite and the alum are given very thoroughly in the report of Mr. J. Bosley Thomas, bacteriologist for the Department, and the tables prepared by Mr. Thomas most carefully and thoroughly show the condition of our water supply during the past year.

Mr. Thomas' report is given in Appendix No. 5.

Several of the farms purchased in connection with the construction of the new Loch Raven dam were leased for a nominal rental, with the object of sowing them in grass. That is, the tenants planted grass crops along with such other crops as corn and wheat, leaving the fields sowed in grass after the other crop had been harvested.

In the operations of the Forestry Department 94,485 young trees were purchased and set in the nursery. Twenty-six thousand seven hundred and eighty-six trees were transplanted from the nursery to high ground on the west side of Loch Raven south of the Meredith's Ford Bridge. One thousand three hundred trees were purchased and set in the nursery for future street planting. The City Forester has been working with the Water Department during the year and has developed a plan for tree planting along the greater part of the water shed now owned by the city, and planting on a large scale will be started during the spring of 1914 on the property which the city now owns.

A description of the planting plan worked out by the City Forester, together with a map, is given in Appendix 6.

FILTRATION DIVISION

Before outlining the work done at the Filtration Division during the year, a description is here given so that the details of this work can be better understood.

The Filtration Plant originally recommended by Messrs. Stearns & Freeman contemplated the building of coagulating basins and slow sand filters. The reasons for changing these plans are outlined in the report of Mr. George W. Fuller, which is given in Appendix No. 1.

The present plans contemplate the building of:

First—Low lift pumping station.

Second—Aerators.

Third—Filtration plant proper, including the chemical house, coagulating basins and filters.

Fourth—Filter water reservoirs.

Low-Lift Pumping Station.

Had the high dam been built, the water would flow by gravity to the filtration plant during ordinary seasons. Should there be a protracted dry spell, however, requiring that the water back of the new dam be drawn down for a distance of about ten feet, it would then have become necessary to have put in low lift pumps to raise the water to the filtration plant. Mr. Allen Hazen, in his report to Messrs. Stearns & Freeman upon the filtration plant, recommended the putting in of a screw pump for this purpose.

An additional reason for having pumps available even with the high dam is the desirability of aerating the water in order to remove

tastes and odors due to algae growth in Loch Raven, should this ever become necessary, as the filtration plant will not remove the tastes and odors due to these growths. Studies were made during the year 1912 into the various forms of nozzles which might be used for aeration and the results of these experiments were given in the report for 1912.

The decision not to construct the high dam at the present time made it necessary to build a more elaborate pumping station than would have been required for these intermittent purposes, but the cost of the pumping machinery and station itself is not a very material part of the cost of the filtration plant, as it amounts to not more than $50,000 in the total expenditure of about $1,750,000, and of this amount only about one-half of it is in excess of what would have been expended had the high dam been constructed.

The plan of this pumping station is shown on the accompanying drawing, No. 71-A-4. The existing Loch Raven-Montebello tunnel, bringing the water from the Gunpowder River to the city, will be tapped by a vertical shaft, and the suction from the low lift centrifugal pumps will extend down into this vertical shaft. The pumps will be arranged around this vertical shaft as shown on the drawing and the pumping station itself will be circular in form.

At the present time there will be four units installed, one having a capacity of fifty million gallons per day, two having a capacity of forty million gallons each per day and one having a capacity of thirty million gallons per day. These capacities are varied in this manner so that it will be possible to operate the pumps at their rated speeds to give the amount of water required by the city consumption which varies considerably from season to season. It is estimated that the lowest daily consumption required will be about seventy million gallons per day, and one forty-million-gallon pump and the thirty-million-gallon pump will furnish this amount of water. Should the consumption reach eighty million gallons per day, the two forty-million-gallon pumps will be brought into operation. Should the consumption reach ninety million gallons per day, one forty-million-gallon pump and the fifty-million-gallon pump will be placed in operation. And so the use of the pumps will be varied according to the daily consumption, and by using the pumps at their rated capacities it is anticipated that the greatest efficiency in the operation of the pumping station can be secured.

After a close study of the existing conditions, it was decided to operate the pumps by means of electricity instead of steam. The fact that the pumps will be used only intermittently after the high dam is completed, combined with the low price at which electricity can be obtained from the Susquehanna, did not seem to warrant the large expenditures required for installing a steam driven plant.

Another very important factor in making this decision is the fact that it is practically impossible to bring a railroad siding into the filtration plant and all coal for operating the steam plant would have had to be hauled a distance of approximately two miles.

One of the advantages of the circular form of pumping station is that a comparatively simple arrangement can be made for handling the machinery by means of a radial hand operated revolving crane.

The pumping station and the shaft are so arranged that the water can be delivered to the filtration plant or it can be by-passed into the tunnel leading into Lake Montebello. A large 60-inch valve or sluice gate is also provided in the shaft by means of which the water can be allowed to flow by gravity directly into Lake Montebello as it does at the present time, if at any time it should become necessary to cut out the filtration plant entirely for any extensive repairs or improvements. This is a very remote contingency, but it seemed worth while to make this provision as it could be done at a comparatively small cost.

Aerators

Mr. George W. Fuller recommended that provision be made for aeration of water, at least on paper, and such provisions has been made along the conduit between the pumping station and the head house at Lake Montebello, as is shown on the accompanying drawing No. 87-A-4.

If the intake at the new dam can be arranged so that bottom water can be effectively drawn off during the summer months it may be possible to escape the necessity of using aeration, but it is deemed best to make some provision for combating the difficulties which may arise from the essential oils released from the microscopic growths and the decomposition products resulting from the loss of dissolved oxygen in the bottom water.

Plans for aeration have therefore been made, although the aerators themselves will not be constructed unless they become absolutely necessary in order to remove unpleasant taste and odors from the water which cannot be removed by filtration.

HEAD HOUSE, PUMPING STATION & CONDUIT
GENERAL PLAN

AUG. 1, 1913

0 20 40 60 FT

SHEET NO 1 OF 13

James W. Armstrong
ENGINEER, FILTRATION DIV

Geo. B. Whitman
WATER ENGINEER

Drawing No 87-A-3

Head House.

The water after leaving the pumping station passes through an eight-foot conduit into a Venturi meter and from there passes through chambers in the conduit to be used in case aeration is found to be necessary. This eight-foot conduit is extended to just outside of the head house, where its suction is changed so that it enters the head house as a rectangular shaped conduit ten feet two inches wide by five feet high. Before entering the mixing basin a stilling chamber is provided for the purpose of taking care of any quick changes in the operations of the pumps.

In the head house are stored the various chemicals used in the treatment of the water, and here also are located the apparatus and devices for automatically controlling the application of these chemicals to the water before entering the mixing basin. It is proposed to use lime and sulphate of iron for coagulating purposes, although alum could be used if this were found desirable.

There are two reasons why the lime and iron are used instead of alum. In the first place the lime and iron will be cheaper in the cost of chemicals, and in the second place, it is not anticipated that there will be as much trouble from red water due to rust in the iron pipes of the distribution system and the pipes in the houses where lime and iron are used, as would be the case were alum used.

Provision is also made for adding calcium hypochlorite to the water after it has passed through the filtration plant. It is anticipated that only a small quantity of hypochlorite need be used to kill the few remaining germs that are in the water after it has passed through the filters. The use of hypochlorite is largely a precautionary measure to kill pathogenic bacteria which might pass through the filters, although it is not anticipated that there will be many bacteria of this type that will survive the passage of the water through the filtration plant.

It will be practically impossible to bring the chemicals into the filtration plant by means of a railroad, so provision has been made to use automobile trucks for this purpose. The trucks will drive on a platform scale located at the northern end of the head house, where the chemicals will be weighed.

The lime will be dumped from automobile trucks on a mezzanine floor in the basement of the building. From here it will be passed through a crusher into the bucket elevator and will be lifted into the tower from where it will be spouted into the storage bins, of which there are fifteen, each one of which measures nine by nine feet inside and is approximately 23 feet deep.

It will be withdrawn from the bottom of the bins into trolley buckets, which will hold about 800 pounds each. These buckets are suspended from an overhead "I" beam which passes over the mixing tanks. The buckets are suspended by roller bearing trolleys and can easily be pushed by one man.

The lime is discharged from the trolley buckets into concrete mixers, which have been especially adapted for the handling of lime. From the concrete mixers the lime is discharged into steel troughs which lead to the solution tanks, of which there are three, each 14 feet in diameter by 14 feet deep. As the lime tends to settle very rapidly, it will be kept in suspension by means of propeller blades operated at 750 revolutions per minute by motors placed below the tank. From the solution tank the lime flows directly to the chemical controllers and after passing through the controllers is applied to the water at the point where it enters the mixing basin.

The sulphate of iron will be handled in the same manner as the lime, except that it will not be passed through the crusher and will be dissolved in concrete boxes to which the water is applied through a pipe grid supported on the floor of the boxes. The solution will be stored in four concrete tanks, each measuring 12 by 9 feet inside by 16 feet deep. The sulphate of iron will be piped to the mixing basin, where it can be added at various points along the center passage as it may be deemed most advisable to apply it.

The hypochlorite of lime will be received in steel drums weighing from seven to eight hundred pounds and will be lifted on the freight elevator to the mixing floor, where they will be transported to the dissolving boxes by means of an overhead trolley. The dissolving boxes are designed so that the drums can be opened under water, thus saving the annoyance due to the escape of chlorine gas. The hypochlorite of lime will be added to the water at points at the east end of the filter galleries as the water enters the basins under the filters.

Mixing Basins.

The water enters the mixing basins from the stilling chamber of the head house. This mixing chamber is covered with groined arches, as shown on Drawing No. 58-A-3, and it is divided up into passages eight feet wide by means of wooden baffles as shown on Drawing No. 61-A-3. The time of passage of the water through the mixing basin based upon the rated capacity of one hundred and twenty-eight million gallons per day is approximately thirty-one minutes. The velocity with which the water will flow through the channels between the baffles at this rate would be approximately one foot. The wooden baffles are not continued throughout the entire basin, but provide for only about sixteen minutes' mixing.

Drawing No 55-A

At the middle point of the mixing basin two 72x72-inch gates are provided to take the water into the intermediate passage of the center conduits, as shown in Section C-42 of Drawing No. 58-A-3, and this intermediate passage delivers the water into the coagulating basins. This will be the ordinary course of the water through the mixing basin at times when the water is turbid.

When the raw water is comparatively clear and a small amount of chemical is being used it is not anticipated that it will be necessary to pass the water through the coagulating basins, but it can be passed through the baffles in the mixing chamber and then through the lower half of this chamber around the wooden baffle, as shown on Drawing No. 61-A-3—on the "Key Plan of the Wooden Baffles and Strut." The water will then be drawn out of the mixing basin into the upper conduit of the center passage through two 72-inch gates, as shown on Section C-43 of Drawing No. 58-A-3, and in this upper passage it will be carried directly to the filters without passing through the coagulating basins.

The floor of the mixing basins is laid on a 0.66 per cent. grade, sloped toward the center passage. When the sludge from the chemicals is collected in the mixing basins to such an extent as to cut down the time of the passage of the water through the basin, this sludge may be removed by flushing it to the gutter along the center passage wall. This gutter along the center passage wall drains to four sumps, one of which is shown on Section C-44 of Drawing No. 58-A-3. Then by means of 18-inch sluice gates this sludge can be flushed into the main drain or the lower conduit of the center passage, which drain will carry the sludge to the wash water dam, which is shown on the General Location Plant Drawing No. 30-A-3.

Coagulating Basin.

The water enters the coagulating basins from the intermediate conduit of the center passage near the bottom of the coagulating basins through five 48x48-inch sluice gates. The advantage of having five of the gates is to distribute the flow as uniformly as possible across the entire width of the entrance-half of the coagulating basins. The general plan of these basins is shown on Drawing No. 55-A-3.

The water, after entering the basins, passes along the length of the basins and around the end of the concrete baffle wall and runs back to the center passage where it passes over a 4-inch skimmering wier and is drawn off into the upper conduit of the center passage by means of five 54x54-inch sluice gates.

The location of the inlet opening in the center passage wall is shown in Section C-26 of Drawing No. 49-A-3, while the outlet openings in the center passage walls into the upper conduit are shown on Section C-12 of Drawing No. 51-A-3.

The coagulating basins, as can be seen from the General Plan on Drawing No. 55-A-3, are practically divided into two compartments by the reinforced concrete baffle wall passing down the center of the basin from the center passage, dividing each one of these two basins in half.

There are gutters which slope toward the center passage, and the floors are so laid that they slope to these gutters from all directions. When the coagulating basins become so filled with sludge that it becomes necessary to clean them, the water is drained from them. At the wall near the upper end of these gutters a 12-inch gate valve is located which carries raw water from the head house before the chemical is added to the point at the upper end of the gutters. The 12-inch gate valves above mentioned are then opened and the raw water flowing from this gate valve is used to carry the deposited sludge down the gutter and into the main drain under the center passage through the 18-inch sluice gate built in a sump at the end of the gutter, as shown on Section C-16, Drawing No. 53-A-3, and also on the same sheet on the horizontal section marked "18-inch Drain from Coagulating Basin No. 2."

In order to flush the sludge to this main gutter, hose connections are provided from 4-inch cast-iron water pipes, which are connected with the regular city mains under a pressure of about forty pounds. The details of this flushing water system are shown on Drawing No. 55-A-3.

Three 60x72-inch sluice gates are provided in the division wall between the two coagulating basins at a point near the center passage, as shown on Drawing No. 58-A-3. The two coagulating basins can be used in series if it is found desirable to operate them in that way by opening these three sluice gates. The time of passage of water through each one of the coagulating basins, based on the rated capacity of 128 million gallons for the plant, is approximately one and one-half hours, and with the two coagulating basins in use, either in series or parallel, it would therefore require three hours for the passage of the water through them.

Filters.

The coagulated water, after leaving the mixing basins or the coagulating basins, enters the upper conduit in the center passage, and from this conduit is delivered the coagulated water conduits in the two pipe galleries as shown on Drawing No. 31-A-3, and from the pipe galleries can be delivered to anyone of the thirty-two filter units. In the typical section on Drawing No. 41-A-3 a cross section of this gallery and one of the filter tank units is shown.

The water passes from the reinforced concrete conduit marked "Coagulated Water" through a 30-inch pipe into a filter tank. The details of each one of these filter tanks is shown on Drawing No. 37-A-3. The coagulated water enters the center gutter shown on the cross section F-C on this drawing and flows from this center gutter into the two parts of the filter tank into which the tank is divided by this center gutter.

The sand and gravel are placed in the filter tank to a depth of approximately four feet, the gravel resting upon a strainer system, details of which are shown in Drawing No. 67-A-3, and the sand is placed on top of the gravel. The water entering the filter passes down through the sand and gravel into the strainer system and enters the cast-iron pipe extending under the filtter tanks into the clear water reservoir, as shown on Drawing No. 41-A-3. This outlet piping is connected to the filtered water conduit in the pipe gallery and this filtered water conduit delivers the water into the clear water reservoir. under the filter units. After entering the pipe gallery, however, the water is passed through a rate controller which controls the amount of water which is allowed to pass through the filter and, therefore the rate of operation of the filter.

The filtration of the water through the sand is continued until the dirt and coagulant collects in and on the sand to such an extent that the loss of head makes it necessary to remove the accumulated dirt. This is done by closing the valve into the filter water conduit and opening a valve from the 30-inch wash water pipe which is carried on top of the coagulated water conduit as shown in Drawing No 41-A-3. The wash water under pressure then passes through the piping in the clear water reservoir and enters the drainage system under the sand and gravel layers. It passes through the strainer plates and up through the gravel and sand at such a velocity that it washes all the dirt out of the sand, and the dirty water enters the V-shaped wash water gutters shown on Drawing No. 37-A-3. From these V-shaped gutters it enters the center gutter and is discharged through cast-iron piping into the triangular shaped conduit under the filter water conduit of the pipe gallery. This dirty water then passes from this triangular passage or main drain to the lower conduit of the center passage and is carried toward the head house and enters the 48-inch concrete drain shown on Drawing No. 31-A-3, from which it is discharged into the wash water dam where the mud settles out and the clarified water passes into Herring Run.

The water used for washing the filters is the pure filtered water which is pumped from the clear water reservoirs into the wash water tanks shown on Drawing No. 31-A-3. These wash water tanks are placed at such elevations that they give the proper head to the water to produce the desired rate of flow of water up through the filters to bring about the best washing of the sand in the filters.

The rate controllers which control the rate at which the water passes through the filters work automatically, and if the demands of the city require an increased amount of water, these rate controllers will automatically increase the quantity of water passing through the filters up to the maximum rate at which it is desired to operate each bed. If the demands for water by the city falls off, the rising of the water in the clear water reservoirs under the filters will automatically check the flow of water through the rate controllers.

Filtered Water Reservoirs.

The rate controllers on each filter will take care of all ordinary fluctuations in the use of water by the city. In order to take care of any sudden demands, however, it is necessary to have a reservoir of from three to four hours capacity, considering the average daily consumption for the entire city. Therefore, two reservoirs, each having a capacity of about seven and one-half million gallons, were built to receive the filtered water from the filtration plant.

One of the characteristics of filtered water is that if exposed to the sunlight, algae very quickly grow in this clear water and produce tastes and odors which are most disagreeable. In order to obviate this it is necessary to cover filtered water reservoirs and the two reservoirs which are nearing completion at Lake Montebello are being covered with a groined arch construction.

The water after passing through the filtered water reservoirs is delivered into a nine-foot conduit, which carries the water to the gate house at Lake Clifton, where it enters the main distributing pipes leading to the city.

Letting of Contracts.

The first contract to be let on the filtration work was Contract No. 4, to C. W. Lane & Company, for the filtered water reservoirs. This contract was awarded on November 20, 1911.

The second contract to be awarded was for the railroad spur track into the filtration plant from the United Railways and Electric Company's tracks on Harford road. This contract was awarded to Malcolm W. Hill & Company on March 5, 1913.

Plans and specifications for the main filtration contract, including the coagulating basins, and the entire filtration plant, including equipment, were prepared and bids were asked upon these plans and specifications, which were opened by the Board of Awards on April 30. The lowest bid received was from the Keystone State Construction Company of Philadelphia, Pa., and amounted to $971,187.41.

The following is a copy of a letter sent to the Board of Awards recommending the rejection of these bids:

May 7, 1913.

Board of Awards of Baltimore City.

Gentlemen—At the special meeting of the Water Board to consider the bids received by the Board of Awards on April 30, the Water Board unanimously adopted the following resolution:

"Resolved that the Water Board recommend to the Board of Awards that bids for filters, basins and grading (Contract No. 11) be rejected as being too high, and that the Board further approves of the specifications drawn for readvertising to the end that fuller and more competition will be produced."

In arriving at this conclusion that the bids for the proposed filtration plant are too high, the following data was considered:

Excavation.

Bids received for earth excavation were as follows:

Keystone State Construction Company	$0 80
New York Continental Jewell Filtration Company	85
Oscar Daniels Company	95

The low bid for the excavation for filtered water reservoirs, which are immediately adjacent to the proposed filtration plant, was 35 cents. Other bids received for this same work were 46 cents, 68½ cents, 50 cents, 45 cents, 70 cents, 55 cents, 74 cents and 65 cents. At the Back River Disposal Works the main grading contract was let for 29 cents per cubic yard, while on the second contract, which included only shallow cuts and much more expensive work, the low bidder's price for excavation was 50 cents. The other bids were as follows: 88½ cents, 45 cents, 50 cents, 50 cents, 60 cents, 45 cents, 75 cents, 40 cents and 80 cents.

Judging not only by these bids, but our general knowledge of the cost of excavation work, I consider the bid of 80 cents for earth excavation for the proposed filtration plant much too high.

CONCRETE—CLASS "B."

In connection with our Class "B" concrete for the filtration plant, the bids received were as follows:

Keystone State Construction Company	$13 90
New York Continental Jewell Filtration Company	14 00
Oscar Daniels Company	14 50

This concrete includes wash water and filter tanks and is composed of reinforced concrete of 6-inch, 9-inch and 12-inch walls and 6-inch floors and walls and beams. For similar concrete at Back River Disposal Plant the low bidder's price was $9.00. The prices received from other bidders for this concrete ranged from $8.00 to $12.00 a yard. For similar work a contract was awarded last fall for the extension of the sewage disposal works, and the cost of similar concrete to the Sewerage Commission will be $8.15. The low bid received for the New York filter plant for similar classes of concrete was $10.60, while the average bid was $12.84—the bids ranging from $10.60 to $17.50 per cubic yard. At the opening of the bids for the St. Louis filtration plant, the price bid by the low bidder for similar concrete was $9.68 per cubic yard. The other bids received were $10.44, $11.00 and $13.00. In the light of these bids received for similar work, and my knowledge of the cost of concrete work of similar character, I believe that the price bid by the Keystone State Construction Company of $13.90 for this class of concrete is much too high.

CONCRETE—CLASS "C."

This class of concrete includes floors, basins and galleries, and the bids received for the same were as follows:

Keystone State Construction Company	$11 80
New York Continental Jewell Filtration Company	12 00
Oscar Daniels Company	13 00

The low bidder for the New York filter plant bid $6.50 for similar concrete, while the other bids ranged from $6.00 to $8.25, with the average bid of $6.80. At the Back River Disposal Works, the floor work of which I had charge was paid for at the rate of $5.65 per cubic yard. The other bids for this floor concrete ranged from $5.10 to $8.25 per cubic yard. The present Back River contract now under construction will cost the city $6.20 a yard. For the St. Louis filter plant the floor concrete was let for $7.00 per cubic yard, while other bids received were $5.92, $10.00 and $11.50. The low bidder for the filtered water reservoirs now being constructed adjacent to the proposed filtration plant will receive $7.15 for this class of concrete, while two other bidders bid $7.00 for this class of concrete, and the highest bid received was $11.00. From the consideration of the bids above quoted and my knowledge of the cost of concrete of similar character, I believe that the price bid by the Keystone State Construction Company for this class of concrete is much too high.

Concrete—Class "D."

This class of concrete includes some thin sections, but the bulk of it is for walls from 12 inches to 36 inches in thickness, and the work also includes groin construction under the filters. The prices bid were as follows:

Keystone State Construction Company	$12 20
New York Continental Jewell Filtration Company	12 60
Oscar Daniels Company	13 00

For the filtered water reservoirs the prices received for similar work was $11.20 for the walls and columns and $8.90 for concrete in the groins. Other bids received for these two classes of work for the filtered water reservoirs, which correspond to one class in the contract under consideration, were as follows: $7.30 and $10.60, $9.71 and $9.19, $8.75 and $13.00, $9.60 and $8.20, $9.70 and $9.00, $10.38 and $10.15, $13.00 and $12.00, $11.50 and $14.50.

At the Back River Disposal Plant in connection with the work of which I had charge, the price bid for concrete in walls, principally 12 inches in thickness, was $8.00, while other bids for this class of work were $8.33, $9.00, $8.70, $8.00, $7.75, $9.50, $10.00, $9.00 and $9.00.

For walls 18 inches in thickness and over, the prices received at Back River were $6.50, $6.90, $7.00, $7.50, $7.80, $8.50, $9.00, $8.50 and $8.50. The price which the city will pay for the present contract now being constructed at Back River for walls 9, 10 and 12 inches in thickness will be $7.35; while in the conduits, which have walls 10 inches and 12 inches in thickness, the price paid will be $9.40. From the consideration of these bids and from by knowledge of the cost of the concrete of similar character, I believe that the price bid of $12.00 by the Keystone State Construction Company is considerably too high.

Steel Reinforcing Bars.

There will be nearly two million pounds of reinforcing bars used in the construction of the proposed filtration plant. The prices bid for these reinforcing bars are as follows:

Keystone State Construction Company	4½ cents per pound
New York Continental Jewell Filtration Company	5 cents per pound
Oscar Daniels Company	5 cents per pound

The prices bid for reinforcing steel for the filtered water reservoirs were as follows: 2½ cents, 3¾ cents, 4 cents, 4 cents, 5 cents and 3½ cents.

At the Back River Sewage Disposal Works the prices bid for the reinforcing steel on the work of which I had charge were: 3 cents, .032 cents, 4 cents, 3 cents, 3 cents, 3 cents, 3½ cents, 5 cents, 5 cents and 4 cents The prices bid for the Sewage Disposal Plant now under construction were 2.8 cents and 3 cents. The prices bid for steel reinforcing for the St. Louis filter plant were 2.88 cents, 3⅓ cents, 3¾ cents and 3½ cents. From the consideration of these bids received for similar work and from my knowledge of the cost of bending and placing steel reinforcing work, I consider the price bid for these steel reinforcing bars of 4½ cents per pound as being too high.

I have also averaged the cost of the concrete work in the New York filter plant, the St. Louis filter plant and the Baltimore filter plant, taking the average of the low bidder in each one of the places mentioned, and I find that the average price for the New York filter plant concrete is $7.38, while the average price of the St. Louis filter plant concrete is $9.67 and the average for the proposed Baltimore filter plant concrete, as given by the low bidder, is $12.63. This confirms my view that the concrete items, as bid by the Keystone State Construction Company, are too high.

In regard to the filter equipment item, I find that this item in the Baltimore plant included chemical feed apparatus which was not included in this item in the St. Louis bids. Our estimate of the cost of the chemical feed apparatus is about $10,000 and reducing the bid by this amount would leave the Baltimore bid $375,000. The St. Louis plant is just 25 per cent. larger than the Baltimore plant and the cost of the filter equipment should be almost exactly proportional to the size of the plant. Therefore, by increasing the Baltimore bid by 25 per cent. to make it comparable with the St. Louis bid, I find that the cost would be $468,750. The low bid received by St. Louis for the filter equipment was $432,000. At this place all the bids for the filter equipment were thrown out as being too high. On the same basis as St. Louis, the bid for the filter equipment for Baltimore is nearly 10 per cent. higher than at St. Louis. I therefore feel that the Baltimore bids for the filter equipment are much higher than they should be.

These comparisons cover the principal items of the contract and I am also satisfied that a number of the smaller items are much higher than a fair profit on the work would warrant. Under these circumstances I therefore beg to recommend to your Honorable Board, as I did to the Water Board, that all the bids for the filtration plant be thrown out and that the work be separated so that the excavation and concrete work and other items which can be bid upon by general contractors be let in one contract, while the filter equipment be let in one or more contracts as may be later decided.

In accordance with these recommendations, I have had specifications prepared for the general contract, and I beg to submit them herewith to your Honorable Board for its approval, subject to the approval of the City Solicitor.

Very respectfully,

(Signed) Ezra B. Whitman,
Water Engineer.

Upon the rejection of the bids by the Board of Awards, this large contract was divided into a number of smaller ones, viz.:

Contract No. 11—Filters, basins and grading, which included the excavation and concrete work for the coagulating basins and filters.

Contract No. 12—Sluice gates.

Contract No. 13—Gate valves.

Contract No. 14—Cast-iron pipe and specials.

Contract No. 19—Pumping machinery.

Contract No. 20—Electrical equipment.

Contracts Nos. 19 and 20 not only included the pumping machinery and electrical equipment of the original contract, but also the pumping station. Plans and specifications were also prepared for the filter equipment and the rejection of the original bids for the entire filtration plant was more than justified by the low bids received upon these smaller contracts, which aggregated about $315,000 less than the $971,000 bid by the Keystone State Construction Company.

The progress made on each one of the contracts let is given in the report of Mr. James W. Armstrong, engineer of the Filtration Division, and a report on the failure of the groined arches of the filtered water reservoir, prepared by Mr. John H. Gregory of New York, is given in Appendix No. 3. This report is an excellent treatise on groined arch construction and is therefore included in this report.

The following is a tabulation of the contracts awarded for work on the Filtration Division to December 31, 1913, giving the contract price, amount earned to December 31, 1913, on each contract and the percentage of work done.

TABULATION OF CONTRACTS AWARDED FOR WORK ON FILTRATION DIVISION TO DECEMBER 31, 1913.

Contract Number.	Contractors.	Contract Price.	Amount Earned to December 31, 1913.	Percentage of Work Done.	Description of Contract.
4	C. W. Lane & Co.	$171,748 60	$107,213 70	62.40 per cent.	Filtered water reservoir.
9	Malcolm W. Hill	11,555 00	11,555 00	100.00 per cent.	Railroad.
11	Claiborne-Johnston Company	396,895 65	83,474 20	21.00 per cent.	Filters, basins, gradings.
12	Coffin Valve Company	16,356 00	9,023 00	55.10 per cent.	Sluice gates.
13	Columbian Iron Works	27,234 56	....	....	Valves.
14	Glamorgan Pipe and Foundry Company	44,594 00	12,492 00	28.01 per cent.	Cast-iron pipe and specials.
18	Peddicord Sons Transfer Company	1,856 40	629 68	33.92 per cent.	Drayage.
19	Southwark Foundry and Machine Company	22,809 00	....	....	Pumping machinery.
20	Westinghouse Electric and Mfg. Company	26,800 00	....	....	Electric equipment.
21	Elkan-Tufts Construction Company	94,610 63	22,603 20	23.90 per cent.	Head house, Pumping Station and conduit.
	Totals	$894,459 84	$246,990 78		

No payments have been made on the three machinery contracts, although this part of the equipment is being manufactured in the shops of the various contractors.

GUNPOWDER SUPPLY IMPROVEMENT DIVISION

This Division had charge of the design and construction of the new Loch Raven Dam and all its appurtenant works, including the conduit connecting the new dam with the old Loch Raven Tunnel, the building of about four miles of road and the building of two bridges—one six hundred feet long and one nine hundred and fifty-four feet long. This Division has also had charge of the new tunnel and conduits which will be built to connect the filtration plant with the existing distributing mains throughout the city.

Before detailing the progress of the work on these various contracts, the following description of the investigations leading to the building of the new dam and a description of the dam itself is given, so that the details of this work can be better understood:

New Loch Raven Dam.

The new Loch Raven Dam, which is being built for the purpose of augmenting the water supply of Baltimore, is rapidly nearing completion. The necessity for the increased supply was recognized about ten years ago by Mr. Alfred M. Quick, who was then Water Engineer, and he proposed building a large impounding reservoir in the valley of the Gunpowder River. In 1908 the State Legislature passed an Enabling Act appropriating five million dollars for the purpose of making this improvement in the city's supply. This loan was ratified by the vote of the people in the fall of the same year.

Before proceeding with the construction of the dam in the valley of the Gunpowder, the city administration decided to call in outside experts, and Messrs. John R. Freeman and Frederick P. Stearns were called upon to go over the entire question of improving the water supply for Baltimore. These gentlemen, after a most careful and thorough investigation, submitted a report on March 25, 1910, in which they recommended that the water supply be increased in practically the same manner as that recommended by Mr. Quick, viz., by building a large impounding reservoir in the valley of the Gunpowder River and by the building of a filtration plant.

Present Sources of Supply.

At the present time Baltimore takes its water from two sources. The main source of supply is from the Gunpowder River, which has a drainage area of three hundred and eight square miles above the existing dam. This dam is built of stone and is about twenty-five feet in height above the bed of the river and is located about seven miles northeast of the city limits. The reservoir created by this dam is known as Loch Raven and originally had a capacity of five hundred and ten million gallons. This capacity has been greatly reduced by deposits of silt since the dam was completed in 1881. This long, narrow reservoir, extending between two high hills for a length of four miles, is now filled to such an extent that it has but little larger cross-section that the normal cross-section of the river. By 1900 the capacity of the reservoir was only seventy-eight million gallons, although dredging had been carried on from 1896 to 1900.

In 1900 the city purchased a suction dredge, which was operated continuously until the fall of 1911—the mud from the bottom of the reservoir being pumped through a long pipe line to a point below the old dam. This dredging increased the capacity of Loch Raven from seventy-eight million gallons to about one hundred and seventy-eight million gallons. It is calculated that the annual deposit of silt from 1881 to 1909 was two hundred and twenty-six thousand cubic yards.

The annual yield of the Gunpowder River, according to records kept 'by the Water Department for the past twenty-seven years, has averaged about two hundred and eighty million gallons per day. The minimum flow of the stream, however, has been as low as fifty-five million gallons per day. The present water consumption of Baltimore is about seventy-five million gallons per day. From these figures it can be seen that if sufficient storage is obtained to store the water, which at the present time passes over the dam during rainy periods, the stream-flow of the Gunpowder River is sufficient to supply Baltimore with water for a number of years in the future. It is for the purpose of supplying this storage that the new dam at Loch Raven is being constructed.

From the gate house at the old dam at Loch Raven a tunnel seven miles long and twelve feet in diameter leads to Lake Montebello, just within the city limits. This lake has a capacity of four hundred and ninety-six milllion gallons and is connected by a twelve-foot tunnel with Lake Clifton, which has a capacity of two hundred and sixty-five million gallons.

The second source of supply for the city is from Jones Falls at Lake Roland. Jones Falls has a drainage area above the Lake Roland Dam of about forty square miles and it was first used as a source of the city's supply about fifty years ago. Lake Roland is about five miles north of the city. The original capacity of Lake Roland was four hundred million gallons of water. This capacity has been largely reduced by deposits of silt, but by means of dredging its present capacity is about three hundred million gallons.

The population of the Jones Falls watershed is over one hundred and fifty persons per square mile and is increasing very rapidly. The stream flows through the Green Spring Valley, which has become a fashionable suburb of the city, and there are many villages and handsome residences springing up in this valley. In addition to the pollution from the Green Spring Valley, two of the largest towns in Baltimore County (Towson and Lutherville) are located on streams emptying into Lake Roland, after flowing only a few miles. The sanitary condition of this source of supply is rapidly becoming a menace to the city, but it cannot be completely abandoned until the new dam is completed at Loch Raven. The average daily yield of the Jones Falls watershed is about thirty-five million gallons of water per day.

A masonry aqueduct five feet wide, six feet four inches high and about four miles long leads from Lake Roland to the Hampden Reservoir, which has a capacity of about forty-nine million gallons. Hampden Reservoir is connected with Druid Lake by cast-iron pipes. Druid Lake has a capacity of about four hundred and twenty-eight million gallons.

During periods of heavy rain, when Jones Falls or the Gunpowder River are in a very turbid condition, the gates at Lake Roland and Loch Raven are closed and the muddy water is allowed to go to waste while the city is furnished with clear water from the storage lakes at Montebello and Clifton from the Gunpowder supply and at Hampden and Druid Lakes from the Jones Falls supply.

It can be readily seen that this method of by-passing the muddy water makes it impossible to make use of the greater part of the run-off of the quick thunder showers falling in the summer time and it has often been necessary to draw down on the available storage supply in the city limits at a time when the stream-flow has been very low. This condition of affairs, however, has been remedied to some extent by the use of alum to settle the turbid waters in Lakes Montebello and Hampden. Before the introduction of the use of alum it had been necessary on several occasions to turn very muddy and turbid water into the city mains, very much to the disgust of the entire population of the city.

Capacity of New Dam.

The accompanying blue print gives the stream-flow records of the Gunpowder River from 1883 to 1914. A careful survey was made of the valley of the Gunpowder River for a distance of ten miles above the old dam. This survey having been made, it was possible to compute the capacities of reservoirs behind dams with variable crest elevations, and the following table shows the available storage and other data for dams built to various crest elevations:

TABLE No. 1.

Contour Elevation.	Area Acres.	Capacity Between Contours. Million Gallons.	Total Capacity Below Contours. Million Gallons.
320	11,350	64,863	190,956
300	8,557	48,756	126,093
280	6,407	18,466	77,337

Messrs. Stearns and Freeman, from the stream-flow records of the Department, computed the following table showing the amount of storage that would have been required to supply from the Gunpowder River different daily quantities of water throughout the greatest droughts of twenty-seven years prior to 1910. They first reduced, however, the stream-flow records on an average of 6 per cent. from the quantity shown by the departmental records in order to allow for obstructions on the spillway and for a different formula for computing the flow over the dam:

TABLE No. 2.

Average Daily Water Consumption. (Million Gallons).	Available Storage Capacity Required. (Billion Gallons).	Storage in Equivalent Inches Depth Over Drainage Area of 308 Square Miles.	Length of Longest Continuous Period that Reservoir Would Have Been Below Spillway Crest.

SERIAL NO. 180 - FILED 50 A-7

Messrs. Stearns and Freeman also prepared the following table after a study of the water consumption of the city for a period of thirty years and the growth in population of the city in order to estimate the number of years in the future that the city could safely take its supply from the Gunpowder River:

TABLE No. 3.

Year.	Years From Now.	Probable Population.		Probable Quantity of Water Used per Capita per Day. Gallons.	Total Quantity Water Probably Required, Av'g Million Gallons per Day.
		Per Cent. Growth for Decade.	Estimated Total.		
1915......	5	....	660,000	130	86
1920......	10	20.0	720,000	135	97
1930......	20	17.5	850,000	145	123
1940......	30	15.0	980,000	150	147

A study of the map prepared by the Water Department shows that the crest of the dam can be carried to an elevation of 237 feet above mean tide without making it necessary to flood the tracks of the Northern Central Railway near Phoenix, Md., or to flood the town of Cockeysville, Md. To carry the flood line higher than this elevation would have caused a greatly increased expense. It will also be seen from Table No. 1 that the dam with a crest elevation of 237 feet would give a reservoir with a capacity of about twenty-one billion gallons. Table No. 2 shows that a reservoir with this capacity would give an average daily water consumption of one hundred and seventy million gallons per day, which is approximately two and one-half times the present consumption of the city. This amount of water, it will be seen from Table No. 3, would probably meet the needs of the city until 1950 or later.

Another very important reason for carrying the flow line to this height is that it will make it possible to deliver the water from the resulting reservoir by gravity to the filtration plant, which will in turn discharge the water at a sufficiently high level to supply the middle service of the city without pumping and furnish a greater water pressure in the low service district of the city, which is at present fed by gravity from the present Loch Raven Reservoir with a water elevation of 171 feet A. M. T.

In order to make the greater part of this twenty-one billion gallons available, however, it will be necessary to build a pumping station to pump the water to the filters before the water falls more than ten feet below the crest of the proposed dam.

Owing to certain legal complications in connection with the purchase of property in the valley of the Gunpowder it was first decided to build the dam to a crest elevation of only 192 feet, which would give a storage capacity of a little over two billion gallons instead of twenty-one billion gallons. This dam, with a crest elevation of 192 feet, combined with the existing storage reservoirs in the city, which have an available storage capacity of about one and one-half billion gallons, gives a total storage capacity of three and one-half billion gallons. This would furnish a safe daily capacity of about one hundred million gallons of water.

It also developed that it would not be possible to build a dam with a crest elevation of 237 feet and a filtration plant out of the five-million-dollar loan available for improving the water supply. The present city administration does not desire to ask for a further loan in order to build the higher dam, as the city is already greatly burdened with loans in carrying out the extensive improvements which have been made since the great Baltimore fire in connection with new docks, new sewerage system, new street paving for the entire city, extension of the parks and improvement of the Fire Department and and school systems. It has, therefore, been determined to build a reservoir which will have a crest elevation of 192 feet at the present time, although the foundations for this dam have been laid of sufficient width, not only to extend the dam to an elevation of 237 feet, but to extend it to a further elevation of 280 feet if this should be deemed desirable in the future.

Design of the Dam.

The accompanying diagram shows the section of the dam which will be required when the crest is raised to an elevation of 233½ feet. It is proposed to secure a water level of 237½ feet by placing flash boards upon this crest. In designing the dam, provisions were made for flood water eight feet over the top of the masonry of the spillway and an upward pressure is figured on the horizontal joints and on the bottom of the dam which is equivalent to two-thirds of the head of water at the up-stream face diminishing to zero at the down-stream face of the dam.

The failure of the dam at Austin, Pa., at about the time that the designs for the Loch Raven Dam were being completed, emphasized the necessity of taking every precaution to prevent upward pressure under the bottom of the dam and internal stresses within the body of the dam itself due to water making its way into horizontal joints.

BALTIMORE CITY WATER DEPARTMENT
GUNPOWDER SUPPY [illegible]
Adopted Profile of Loch Raven Dam

Serial ~~No 387~~
Filed ~~S1A 48~~
Date Dec 20, 13
Scale [illegible]

In order to take care of upward pressure under the base of the dam, a system of underdrains has been provided beneath the main foundation and next to the rock. A twelve-inch drain with open joints is placed on the down-stream side of the cut-off wall along the line of the bottom of the foundation of the dam, as shown on the accompanying drawing (No. 51-A-32). Connecting to this drain are a number of six-inch underdrains, surrounded by gravel, which rest on the rock foundation and it is expected that any water which may make its way through the cut-off wall or through the seams of rock on which the dam is built will enter this drainage system without causing any appreciable upward pressure on the base of the dam.

The six-inch underdrains are placed at intervals of approximately thirty feet and they find outlet in risers leading to the top of the foundation apron near its lower end.

The Water Engineer was familiar with the vertical porus drains used in the construction of the Olive Bridge and Kensico Dams in connection with the improvements of the water supply of New York in order to intercept seepage through the body of the dam. It seemed more logical, however, that drains for the purpose should be placed horizontally across the construction joints where the seepage would most naturally occur.

The up-stream side of the dam for a thickness of about seven feet, as shown on Drawing No. 51-A-32, is built of 1-2-4 concrete laid in such a manner that horizontal joints occur at vertical intervals of eight feet. At these horizontal joints, on the down-stream side of the 1-2-4 concrete wall, are laid conduits consisting of porus concrete tile laid in grooves left in this wall. These tiles are fourteen inches square, three feet long and are made of a dry 1-4-8 mixture with the six-inch interior diameter. Expansion joints are provided across the dam parallel to the axis of the stream at intervals of approximately every sixty feet and at each expansion joint there is a vertical well to which the horizontal drains are connected. These vertical wells lead to a gallery built throughout the length of the dam and which gallery drains into the tail waters on the down-stream side of the dam.

The forty-eight inch drain pipes are provided at elevation of inverts of 164 feet A. M. T., one on each side of the spillway, and these will make it possible to drain the lake should it ever be found necessary to do so. These gates will also be used while filling the relief openings which have been left in the first half of the dam to carry the water of the river during the construction of the second half.

Gate House.

The gate house which will control the flow of the water into the city is built into the dam near the west bank of the stream and will be so constructed that there will be duplicate gates which will make it possible to send water to the city through either one or both of the two gate chambers. Should any gate get out of order it will be possible by means of stop planks to shut the water out of the gate chamber and a twenty-four inch drain for the gate chamber is provided, which will discharge into the tail waters of the dam. Provision is also made in this gate house to take water from the varying depths.

During the summer time, when trouble may be experienced from the presence of algae growths, the water for the city will be drawn from the bottom of the lake, as experience has shown that the algae growths are much more numerous in the top layers than in the bottom layers. Should the dissolved oxygen become exhausted in the lower layers and in times of turbid waters, when the top waters will settle clear much more rapidly than the bottom waters of the lake, the waters will be drawn from the top.

The conduits connected with the two chambers of the gate house are each eight feet in diameter and will be brought together just below the gate house into one ten-foot conduit, which is connected with a ten-foot steel pipe line. This steel pipe is surrounded by concrete on the outside and lined with mortar on the inside, which lining has been placed by means of a cement gun and is reinforced with wire mesh.

The gate house, when it is raised to the height recommended by the consulting engineers, will be provided with a hydro-electric plant which will generate electricity—the turbine being operated by the water passing to the city and by using the waste waters in excess of the water being consumed by the city. This current will probably be carried into the city limits and be used at the filtration plant.

The house which will be built over the gate chamber at the present time will be merely a temporary one of wood and shingles. A more permanent structure of stone or concrete would have to be soon torn down as it is possible that the dam will have to be extended to the height recommended by Messrs. Freeman and Stearns in the course of the next ten years.

Arrangements for Bonding High Dam to Present Structure.

When it is decided to carry the present structure up to the height originally recommended, it is proposed to place several rows of porus drains along the steps of the present dam so that any water getting into the joint between the old and the new work will be intercepted before it can produce internal stresses which would threaten the safety of the dam.

In order to bond the new structure to the old, large plum stones are placed projecting above the finished surface of the present structure and these stones will be of great assistance to keep the new structure from sliding on the old.

If it is decided that these plum stones will not furnish sufficient strength to prevent the sliding of the dam, holes can be drilled at regular intervals along the crest of the present structure and iron bars can be grouted into these holes and extended into the new structure. It is believed that the system of drains, combined with the plum stones and the iron bars, will provide sufficient strength against sliding and provide for a sufficient bond between the new work and the old.

Contract No. 1—New Loch Raven Dam.

The contractors for this work were the King-Ganey Contracting Company of New York City, and the following facts in regard to the progress of the work are largely taken from the report of Mr. P. A. Beatty, the assistant engineer in direct charge of the work, made to Mr. Emory Sudler, Division engineer:

The work done during the year 1912 has been described in the 1912 report. The greater part of the construction of the dam inside of the west cofferdam was completed during the first three months of the year.

In the month of April the west cofferdam was broken and construction begun on the east cofferdam. The channel wall parallel with the axis of the stream was built of two lines of planking, two inches thick, placed fourteen feet apart, spiked to range timber and tied across with old steel cables; the space between being filled with soft material in which more or less rock was embedded. On both sides of the wall of the cofferdam a line of boulders was placed to keep the timbers from kicking out, as they were not attached in any way to the concrete. This wall was erected by the contractors contrary to the advice of the resident engineers, who had suggested, during the construction of the dam, that provision be made for attaching the foot of the cofferdam tightly to the concrete. As was anticipated, a great deal of leakage took place along the concrete surface and some through the wall itself. It was finally necessary to build a concrete wall inside of and against this wall of the cofferdam.

In building the channel wall of the cofferdam, north of the dam, the contractor had serious difficulty in making it tight and it leaked badly until a large quantity of rocky material was dumped so as to cut off the current from the east relief opening, when it was possible to control this leak to a great degree. Otherwise, the cofferdam has proved rather tight, with the water at about elevation 168 A. M. T., three feet below the normal level to which elevation it has been generally held during the year, except at the time of freshets.

The excavation has generally been followed closely by concreting. In the east cofferdam the rock encountered has been rather soft, with a considerable amount of mica in it. On this account the excavation was carried rather deeper than in the west cofferdam. It was concluded that the rock would be sufficiently firm to carry any load which might come upon it; that the rough bottom and the rock of down-stream face of the foundation pit would afford ample resistance against sliding, and it was determined to found the dam on this rock, as there appeared to be no reason to expect an improvement in its condition within a practicable depth.

Two-inch pipes were set in the rock at various points and after the concrete was in place these were grouted under a pressure of about eighty pounds. Very little grout was forced out of the pipe under this pressure.

In July, Coleman King resigned as superintendent and J. T. Todd, resident engineer for the city on this contract, was offered the position and accepted it on August 6.

The depth of the cut-off trench averages fifteen feet below the foundation line across the river bed.

Owing to the seamy character of the rock encountered throughout the foundation it has been necessary to go much deeper into the rock in order to secure the proper foundation for the dam than was anticipated from the borings which were originally made. The original estimate of 17,000 cubic yards of solid rock excavation will probably be nearly doubled and it will follow that the amount of concrete used will also be greatly increased over the original estimate. Owing to the increased depth to which it has been necessary to carry the excavation and the fact that the foundations at the two ends of the dam have been laid for the higher dam, the total cost of the work will exceed the original estimate by fully 25 per cent.

The principal quantities of work done to January 1, 1914, are as follows:

Earth, 25,287 cubic yards; loose rock, 5,593 cubic yards; solid rock, 34,758 cubic yards; 1-2-4 concrete, 20,538 cubic yards; 1-2½-5 concrete, 20,528 cubic yards.

Included in the above are the following high dam quantities: 1,912 cubic yards high dam excavation at $1.30, 440 cubic yards cut-off wall excavation at $4.00, 350 cubic yards concrete at $6.75.

In placing the concrete several changes in construction method were allowed. On the west side the concrete was placed continuously between expansion joints, but in order to get over the entire area under construction at short intervals, the spaces between the expansion joints were divided into several blocks which were made truly monolithic for some feet in thickness by concreting day and night shifts. These blocks were made of various heights in such a manner as to afford ample resistance to sliding. The projecting cyclopean stone, which have been used freely through the work, afford additional resistance. All but horizontal joints were finished against forms.

On the east side the contractors were allowed to place much larger areas under construction at a time, these being between expansion joints and usually continuous from cut-off wall to approximately mid-distance from cut-off wall to toe of apron. Except on the cut-off wall only day shifts were run. Where it became desirable, for any reason, to restrict this area, ricks of heavy stone and dry concrete were built, behind which the wet concrete was deposited as usual. It is to be supposed that these "ricks" are more pervious than the surrounding concrete, but it is anticipated that this portion of the dam will not have to resist the passage of water, as it will be relieved of this by the drainage system and that it need not, therefore, be impervious.

On November 15 it became necessary to shoot under the trestle which spanned the east foundation pit and gave railroad communication between the work on the north and south sides of the dam. Owing to the seams in the rock having practically the same slope as the side of the hill, it was feared that a landslide would be started and the holes were very carefully set, loaded and fired. In spite of these precautions a landslide was started and brought down material practically one hundred feet higher up the hill than from the point where the blast was made. This slide occurred on November 15 and carried away the railroad trestle and two derricks, which later had to be reset.

This slide considerably delayed the completion of the work at the eastern end of the dam as it was expected that this blast would be the last one necessary before going ahead with the construction of the dam at this point. It took over a month to get this slide finally cleared out, the railroad trestle rebuilt and the two big derricks re-erected.

An average of two hundred and twenty-five men have been employed on the work during the year. There have been in use on the work eight guy derricks, five stiff-legged derricks, three locomotives, eight dump cars and six flat cars, one one-yard Smith mixer, one No. 3 and one No. 6 McCully crusher, with sand rolls, elevators, screens, bins, etc.

Practically all the stone has come from the city quarry south of the old gate house and it has been of excellent quality. A small amount of stone from the excavation has been used and also a small amount of sand from the river bed was allowed to be used on the work. The greater part of the sand, however, came from the quarry and a sand bank south of the quarry, which is mixed with the stone dust from the crusher. Some of the sand from the Arundel Sand and Gravel Company has also been brought in on the Maryland and Pennsylvania Railroad. Forty-six thousand seven hundred and eighteen barrels of Alpha Cement have been used to date and about 18 per cent. to 20 per cent. of the masonry of the dam is composed of cyclopean stone.

The sanitary conditions of the camp and the health of the men have been very carefully watched throughout the year and during the summer months—monthly inspections having been made by the Health Commissioner of the City of Baltimore. The sanitary conditions of the camps and the health of the men have been very satisfactory. For the contractor, Dr. Daniel of St. Thomas Jenifer has been the physician in charge. There have been a number of minor accidents and one laborer lost his arm and one lost his life.

Contract No. 2—Masonry for Bridge No. 1.

This contract was awarded on October 23, 1912, to the Singer-Pentz Company and was sub-let to Williams & Strauss, who completed it on July 3. Mr. J. E. Greiner was called upon as consulting engineer in connection with the design of the superstructure for this bridge and upon his recommendation the width of the bridge was increased. This made it necessary to increase the width of the masonry to correspond with the increased width of the superstructure. The work on the masonry, as completed, presents a pleasing and substantial appearance and the contractors, as well as the engineers in immediate charge of the work, are to be commended upon the results secured.

Contracts Nos. 3 and 5—Steel Pipe Conduit and Venturi Meter Tube.

Contract No. 3 was awarded to Mason, Hilton & Company of New York City on December 11, 1912, but no work was really done until after the first of the year. This contract included 2,465 feet of steel

DATE SEPT 5 1912

pipe ten feet in diameter and seven sixteenths of an inch in thickness. The total weight of the pipe was 1,600,000 pounds. After the excavation of the pipe was completed, concrete cradles of the diameter of the pipe were placed in the trench 7½ feet apart on tangents and 6.98 feet apart on curves. The steel pipe work was sub-let to the Riter-Conly Manufacturing Company of Pittsburgh, Pa. The steel pipe was placed on these cradles and riveted together. After the pipe was riveted together, it was filled with water and tested to the maximum pressure under which it will operate after the high dam is completed. All leaks were caulked with the pipe under pressure, and after these leaks were stopped a concrete casing was placed around the pipe in the manner shown on the accompanying Drawing No. 53-A-4.

When the water was first placed in the pipe the lateral pressure caused the pipe to flatten out in some places almost as much as a foot. As the pressure was increased, however, the pipe came back nearly to its normal shape, the maximum deformation being from three inches to four inches. It was in this shape when the concrete casing was placed and pressure was kept on the pipe during the whole time of the placing of the concrete.

After the outer casing of concrete has been placed the pipe was then drained and the interior surface of the steel conduit was covered with 1½ inches of mortar, placed by means of a cement gun, which mortar was reinforced with wire fabric. The placing of the cement mortar lining was sublet to the New York Cement Gun Company of New York City.

Several hundred feet below the dam a Venturi meter was placed in this conduit for measuring the flow of water to the city. The interior diameter of the throat of this meter in forty-five inches and the length of the Venturi meter tube is ninety-one feet. This Venturi meter tube and the throat and up-stream castings were furnished by the Builders Iron Foundry Company of Providence, R. I., while Mason, Hilton & Company, under their contract, placed this meter and lined the tube with mortar in a similar manner to that in which the conduit was lined.

This contract was completed in December on contract time. The entire contract was handled in a workmanlike manner from start to finish, with the exception of part of the cement lining. While the side walls and roof of the conduit are put on fairly smooth, the work on the invert has been a disappointment. In a number of places in the invert the rebound was covered over by the cement gun, and the men walking over the invert before it was set caused a considerable amount of roughness. By sounding with a hammer, these places where the rebound was covered with mortar were discovered and these have been cut out and refilled with solid mortar.

Contract No. 6—Superstructure for Bridge No. 1.

This contract was let to the Roanoke Bridge Company of Roanoke, Va., on March 12.

Through fear of freshets in the Gunpowder River it was decided by these contractors not to build the ordinary false work, but to build the false work in the form of a suspension bridge. Twelve 1½-inch cables were stretched across the river and the ends of each cable are anchored to two 10-foot to 12-foot eye bars set in holes drilled in the rock back of each abutment. These eye bars were then grouted in and inside the excavation pit, just above the rock, a reinforced concrete slab 18 inches thick was placed over these eye bars. On these twelve cables two timber catenary trusses were built and upon these catenary trusses the bridge is being erected. The cables pass through holes drilled in the back walls of the abutments and rest on saddles of cast iron placed on the bridge seats on the abutments and on top of the pier. The work on the anchorages for these cables was begun in July, but the excavation and drilling of holes for the eye bar anchors was not completed until November. A great deal of difficulty was experienced in drilling the holes to receive the anchor bolts and it would have been much cheaper for the contractor had he excavated the rock to a depth of ten or twelve feet and then surrounded the eye bars with concrete filled in this excavation.

The steel for the bridge began to arrive on the ground on September 19 and was all delivered by December 15. The entire contract should have been completed in November to have been completed on contract time.

The contractors claim that they have had a great deal of trouble in securing competent labor and that the unforeseen difficulties in securing proper anchorages for the cables greatly retarded the work, and there is no doubt but that these difficulties were real ones. The total weight of this bridge will be about 950,000 pounds and the flooring will be laid on creosoted oak lumber.

9 SHEETS, SHEET NO. 3

CONTRACT NO. 1

SERIAL NO. 190
FILED 51-A-32
DATE 2-8-12

Contract No. 7—Road No. 1.

This contract, for the construction of 1.9 miles of road along the west side of the Loch Raven Valley, was awarded to Thomas Mullan on April 30, 1913.

This road will take the place of the old lake drive which runs along the west bank of the old Loch Raven. This road will be constructed at such an elevation that it will be above the waters of the proposed high dam, having a crest elevation of 237 feet A. M. T. It was at first proposed to make this road skirt the edge of the lake in the same manner that the old road does, but it was found that the cost of following the edge of the lake would be excessive owing to the fact that the road would have been located on a very steep, sloping hillside, with rock outcropping along the entire surface. It was therefore decided to leave the lake for a part of the route, which shortened the length of this drive by one mile and probably cut the cost of the road in half.

Work on this contract was begun the first part of June. Owing to the fact that the work on the dam and the steel pipe conduit interfered with the construction of this roadway at the lower end, this contract was not pushed, as it would have been impossible to complete the lower end of this roadway. It was also deemed advisable to allow the fills to settle throughout the winter before the road material was placed on them. The contract time for completion of this work was therefore extended until forty days after the first of April in the year 1914.

The culverts for the roadway have all been completed, excepting the one at Rushbrook, and the grading was practically completed before the end of the year.

Contract No. 15—Superstructure for Bridge No. 2.

This bridge is located about 4,400 feet above the present Meredith's Ford Bridge. The east end of the bridge will be connected to the Jarrettsville Turnpike near Mann's Hill and the west end will be connected with the Valley Road, running along the west side of the Gunpowder River and connecting to the Dulaney Valley Turnpike at the small village of Bosley. The location of this bridge is shown on the accompanying map.

The building of this bridge is the result of a number of conferences with the Baltimore County Commissioners and other interested parties living in the neighborhood of the new dam and using these roads. It had been proposed to build only Bridge No. 1 for the present, but owing to the protests of the people using the Jarrettsville and Dulaney Valley Pikes it was decided by the city to build the second bridge, so that the people using both these pikes would have the shortest possible route to Towson and to Baltimore city.

Bridge No. 2, which is also known as Mann's Hill Bridge, will be 954 feet over all and at the west end of the bridge there will be a fill about 400 feet in length, which will afford the approach to the west end of the bridge.

Mr. J. E. Greiner was called in as consulting engineer in connection with the design of this bridge and owing to the natural beauty of the location it was decided to make some attempt at ornamentation. This ornamentation will cost but very little more than a plain bridge and the greater harmony between the bridge structure and its beautiful surroundings is certainly worth the small amount of money the city will expend to increase the attractiveness of this bridge. No attempt has been made at any elaborate ornamentation, but the appearance of the bridge is a great improvement over the appearance of Bridge No. 1, erected at Peterson's Run.

The contract for this bridge was let to the McClintic-Marshall Company of Philadelphia on September 17, 1913. Shop drawings have been approved and the steel work is being manufactured in the shops.

Contract No. 16—Sub-structure for Bridge No. 2.

The contract for the sub-structure of Bridge No. 2 was let to Stewart-Jones Company and Claiborne, Johnston & Company on June 11.

Mr. J. E. Greiner was again called in as consulting engineer for the sub-structure and upon his recommendation the design of the sub-structure was changed in such a manner that the cost of the concrete work was considerably increased. The greatly improved appearance of the completed structures, however, was certainly worth the additional cost of these sub-structures.

A cable-way was used for constructing this sub-structure work; the cable being supported by two towers 1,046 feet apart. The west tower was 102 feet high and the east tower 76 feet high. The sag of the cable was practically 48 feet and it cleared the top of the middle piers by about 33 feet. The west abutment was 40 feet high above the foundation. The first pier was practically the same height. The second pier was practically 75 feet high from the foundation to the top. The third pier was about 80 feet high. The fourth pier was 42 feet in height and the east abutment was about 25 feet in height.

FILED ~~53-A-34~~

The west abutment and the first pier were founded on clay with a spread foundation, while the other piers and the east abutment were founded on limestone rock.

The work on this contract has been done in a very satisfactory manner and the results obtained are very pleasing.

By the end of the year the west abutment and the first three piers were completed and the east abutment was well under way and the foundation for the fourth pier was ready for concrete.

On September 30, Stewart-Jones Company withdrew from the work, leaving the completion to Claiborne, Johnston & Company.

Contract No. 17—Distribution Mains.

This contract, for the construction of the distribution mains connecting the filtration plant with the existing city mains, was let on December 31, 1913, to the Lock Joint Pipe Company of New York.

The existing tunnel between Lakes Montebello and Clifton could have been used for part of the connecting link had it been constructed in such a manner as to have made it possible. This old tunnel, however, was built for a gravity flow between Lake Montebello and Lake Clifton and as the elevation of the water surface of the filtered water reservoirs is 213 feet, or 50 feet A. M. T. higher than the water in Lake Montebello, this tunnel would have been placed under a pressure for which it was not designed.

The cost of building an entirely new conduit from the filtration plant to Clifton Gate House was investigated and compared with the cost of building a pressure tunnel inside of the existing 12-foot tunnel between Lake Montebello and Lake Clifton. By building a pressure tunnel nine feet in diameter inside of the existing tunnel the cost of excavation was done away with and it was decided to build the new tunnel inside of the old one. This construction work, however, will have to be done at the same time the city is being supplied with water which must flow through this conduit.

This will be accomplished by filling Lake Clifton with water, which holds between three and four days' supply for the city. After the lake is filled, the water will be drained from the conduit and the contractors will work day and night, placing the new pressure conduit inside of the old one, for a period of from two to three days. Then the contractors must withdraw from the tunnel and allow the water to flow from Lake Montebello to Lake Clifton until it is again filled. Then this operation will be repeated until the new pressure conduit is completed inside of the old gravity conduit.

After witnessing a number of tests made by the Lock Joint Pipe Company of reinforced concrete pipe under pressure, which test not only included the test of the pipe itself but the joint devised by this company, it was decided to call for alternate bids on this contract for the use of either steel pipe conduit or reinforced concrete conduit.

The conditions under which this new pressure conduit is to be built are ideal for the use of reinforced concrete. For the building of this new conduit in the old one, which has been completed for over thirty years, will give the reinforced concrete conduit an absolutely solid foundation, so that there will be no danger of settlement such as might be experienced in excavated trenches and the temperature in this old tunnel will vary very little even during the course of construction, while the temperature changes during construction in an open cut would be very material.

This large reinforced conduit under a pressure of nearly 35 pounds, built of separate pieces of concrete with joints every six feet, is practically the first conduit of its kind to be built within the knowledge of the writer.

By allowing the use of the reinforced concrete in competition with the steel, the city was able to save $127,000.

Contract No. 24—Road No. 3.

This contract is for the building of a road from the east end of Bridge No. 1 to the Dulaney Valley and Sweet Air Turnpike and was awarded to Thomas Mullan on September 24. Bids were asked for concrete roadway in competition with macadam as it is believed that the experience in other places warrants the building of concrete roadways rather than macadam, although the concrete may be considerably more expensive in first cost. The ordinary macadam road, however, does not stand up well under automobile traffic and it was anticipated that the saving in the maintenance by the use of concrete would more than offset the additional first cost. This additional first cost, however, proved to be comparatively small, the bid for the concrete roadway being only $2,892.96 more than the cost for the macadam roadway.

Some little work on the grading and the establishing of a crusher plant in one of the city's quarries is all that has been accomplished on this contract by the end of the year.

The following is a tabulation of the contracts carried out under the work of the Gunpowder Supply Improvement Division during the year:

TABULATION OF CONTRACTS AWARDED, GUNPOWDER SUPPLY IMPROVEMENT DIVISION TO DECEMBER 31, 1913.

Contract Number.	Contractors.	Contract Price.	Value of Work to December 31.	Percentage of Work Done.	Character of Work.
1	King-Ganey Contracting Company.........	$374,884 40	$371,039 50	90 per cent.	New Loch Raven Dam.
2	Singer-Pentz Company—Williams & Straus, sub-contractors	19,912 80	25,701 62	100 per cent.	Masonry for Bridge No. 1.
3	Mason-Hilton Company	143,190 80	157,555 90	100 per cent.	Steel pipe conduit.
5	Builders' Iron Foundry..................	5,420 00	4,320 00	80 per cent.	Venturi meter.
6	Roanoke Bridge Company...............	50,915 00	38,675 34	76 per cent.	Bridge No. 1.
7	Thomas Mullan.......................	47,649 50	22,525 18	48 per cent.	Road No. 1.
8	Coffin Valve Company..................	3,246 00	3,246 00	100 per cent.	Sluice gates.
10	Coffin Valve Company..................	1,620 00	1,620 00	100 per cent.	Gate valves.
15	McClintic-Marshall Company..............	86,750 00	No payment.	Shop work underway.	Bridge No. 2.
16	Stewart-Jones Company and Claiborne, Johnston & Co.......................	*24,785 00 †28,785 00	25,565 14	90 per cent.	Masonry Bridge No. 2.
17	Lock Joint Pipe Company...............	‡225,924 97	....	....	Distribution mains.
24	Thomas Mullan	31,566 91	2,494 81	8 per cent.	Road No. 3.

*Original.

†By later agreement.

‡Awarded December 31.

NOTE—Contract No. 1 extended to cover additional concrete for future extension of dam.

NOTE—Contract No. 2, subsequent to award, plans changed to cover wider bridge, increasing amount of masonry.

NOTE—Contract No. 16, plans revised subsequent to award, increasing cost of concrete.

Respectfully submitted,

Ezra B. Whitman, *President*,
Richard Bernard, John Sterkel,
Telfair W. Marriott, Charles W. Jones,

Water Board of Baltimore City.

REPORT OF ENGINEERING DIVISION

BALTIMORE, December 31, 1913.

MR. EZRA B. WHITMAN, *Water Engineer.*

DEAR SIR—I submit herewith the annual report of the operations of the Engineering Division for the year ending December 31, 1913.

During the year this Division has been engaged in its usual work of preparing plans for work done by the Construction and Mechanical Divisions, preparing plans and specifications for and supervising work done for the Department by contractors and making the usual tests, inspections, etc.

Plans were prepared for all the mains laid by the Construction Division, including mains from 4 inches to 48 inches in diameter, amounting in all to 90,812 feet, or 17.2 miles of mains.

The 48-inch Middle Service Main in Ensor street has been completed to North avenue.

All the large mains in connection with the improvements to the High Service distribution in the vicinity of Mount Royal Pumping Station have been completed, except the 48-inch discharge main in Malster avenue, between the pumping station and North avenue. Owing to the heavy demand for water on this service it was not deemed advisable to make any changes in piping during the summer months. The work was begun on November 1, 1913, and is now well under way.

The work of installing the new vertical triple expansion high duty pumping engine, boilers, etc., at Mount Royal Pumping Station has been completed by the Bethlehem Steel Company, according to their contract of August 31, 1911. The official test of the boilers was made on May 24. No. 4 boiler was selected as the test boiler, and the performance when operating under normal working pressure of 175 pounds per square inch gives the following results, as compared with the requirements of our specifications:

EVAPORATION TEST.

	Specified.	Actual.
Smokeless burning of bituminous coal per square foot of grate surface per hour	25.0	38.8
Degrees of superheat (F.)	50.0	77.0
Economic evaporation from and at 212° F. per pound of dry coal	10.5	11.09
Boiler horsepower developed	206.0	281.0
Efficiency of boiler (per cent.)	.....	81.72
Efficiency of boiler and grate (per cent.)	74.0	76.63
Percentage CO_2	.....	11.40

The performance of boiler and stoker, both from the standpoint of economy and ease of operation, was creditable. The boiler would have shown a better efficiency than the satisfactory 76.63 per cent. stated above had it been operated a little closer to its normal rated capacity. Moreover, this efficiency was obtained with a coal of lower calorific value (13,800 B. t. u.) than the value specified by the American Engineering Company of 14,500 B. t. u. as fired. The evaporation rate is 10 per cent. in excess of our specifications; the degrees superheat, 27 degrees higher than called for.

CAPACITY TEST.

	Specified.	Actual.
Degrees of superheat (F.)	50	96
Economic evaporation from and at 212° F. per pound of dry coal	...	9.273
Boiler horsepower developed	309	435
Rise in temperature of feed water through Green Economizer (degrees F.)	100	119
Efficiency of boiler (per cent.)	...	67.28
Efficiency of boiler and grate (per cent.)	...	63.65
Percentage CO_2	...	12.48

The boiler developed 60 per cent. in excess of the overload capacity required by the specifications. The Green Economizer, when operating with one boiler, gave 10 per cent. better performance than required.

On September 18 the pumping engine was given a twelve-hour duty trial to determine the capacity and economy of performance.

During the trial the pump was operated as uniformly as possible against a net discharge head of 92½ pounds per square inch for 212 feet head and at a speed of 25 r. p. m. The specifications called for a performance in duty of not less than 173,000,000 foot pounds of work computed on plunger displacement for each 1,000 pounds of steam furnished to the engine. In this connection please note the performance which is given for each successive hour, and the average duty obtained from the entire trial, which in every case is better than the above figure.

The water rate, or steam per I. H. P. per hour, you will also notice, is very economical, being 9.787 pounds, and with an evaporation rate in the boiler of 8.167 pounds of steam per pound of coal, gives the coal per I. H. P. per hour as 1.198 pounds.

While it is true that during this trial no steam was charged against the engine, except that actually involved in the test, while in our former operation with the Worthington Units, it has been customary to charge all steam used for auxiliary apparatus, it is interesting nevertheless to note the pumpage in gallons per pound of coal, with 865.29 gallons for the Bethlehem Vertical Unit, as against the common value of 350 to 375 gallons for the Worthington Units.

The efficiency of the engine as obtained from the indicated horsepower shows an efficiency performance of 96.92 per cent., while the thermal efficiency of 19.61 per cent. shows that full utilization of heat energy in the steam has been secured within practical attainments. The combined efficiency of the pump unit as based on indicated horsepower on the steam end and water horsepower on the plunger displacement and net head is 93.14 per cent., which gives as the total engine and pump load 6.86 per cent.

The duty of the pump per 100 pounds of coal on plunger displacement is 153,895,500 foot pounds, while the capacity of the pump in gallons per 24 hours is 22,868,000.

At the beginning of the year a survey was undertaken to ascertain by pitometer measurements the amount of underground leakage existing on the mains and service pipes in the streets and on plumbing fixtures inside of houses. The method of procedure is to isolate a district of about twenty city blocks, closing valves so that all water supplied to the district must necessarily pass through a single main. A pitometer and recording instrument are connected to the main, so as to accurately measure all water fed to the district. Careful readings are taken of the flow between midnight and 4 A. M. (the time when the least water is being used). A house-to-house inspection for the location of leaky fixtures, service pipes and mains is made during the day and as repairs are made the decreased flow is noted. If, after all visible waste has been eliminated, there is still a high rate of consumption in the district, each block is tested separately until the leaks or waste are located and repaired.

The district covered to date consists of all that part of the Western High Service area lying west of Pennsylvania avenue and south of North avenue, and that part of the Low Service area bounded by Madison street, Jefferson street, Central avenue and Bond street.

The house-to-house inspection for leaking fixtures has been made in all that portion of the High Service area between North avenue and Twenty-fifth street.

The equipment for this work consists of a pitometer, an instrument making use of the principle of the Pitot tube for measuring the velocity of flow through a pipe, and a recorder connected to the pitometer instrument, which records graphically on a chart the rate of flow through the pipe being tested. Aquaphones are used to detect waste in houses.

The cost of the work has been as follows:

Labor	$2,400 00
Engineering and inspection	2,100 00
Materials	700 00
Total cost	$5,200 00

The results show that a leakage of about 1,500,000 gallons per day has been stopped in the area surveyed. In the older sections of the city the waste must be considerably more.

TABULATION OF LEAKAGE.

Number of leaking faucets repaired	2,155
Number of leaking water closets repaired	2,607
Number of leaking house boilers repaired	15
Number of leaking inside pipe and fittings	40
Number of leaking curb stops and hose connections	9
Total number of leaking house fixtures	4,826
Number of leaking private pipes repaired	48
Number of leaking supply pipes (inside curb)	65
Number of leaking supply pipes (outside curb)	7
Total number of leaking pipes repaired	120
Number of leaks in mains repaired	37
Number of services turned off for failure to make repairs	139

From the figures resulting from the above repairs it seems that defective house fixtures are responsible for about 60 per cent. of the total leakage, the broken supplies and private pipes for about 20 per cent, and leaks on mains and valves and from street construction work, the remaining 20 per cent. For the lower part of town, with its older pipe, I expect that the percentage of leakage on mains will be much higher.

MATERIAL ON HAND.

Instruments:		
One Lanham electric pitometer recorder	$450 00	
Two Municipal Supply Company pitometer rods	130 00	
One "U" tube recorder	25 00	
One set of hydrometers	5 00	
		$610 00
Equipment:		
Two five foot by seven foot portable offices	$140 00	
Tools, valve keys, etc	200 00	
Office furniture, typewriter, etc	250 00	
Blank forms and stationery	50 00	
		540 00
Total		$1,150 00

The Pitometer Survey organization is also entrusted with superintending the cleaning of water mains. No attempt has been made to do the cleaning by the use of any of the patented apparatus or methods, but it has been done by a method of flushing in alternate directions, developed in this Department. I submit herewith the following table showing the amount and cost of the work:

UPPER SERVICE.

Number of miles of pipe cleaned	29.34
Cost	$235 57
Cost per mile of pipe	8 03

LOW SERVICE.

Number of miles of pipe cleaned	10.97
Cost	$106 75
Cost per mile of pipe	9 89
Total number of miles of pipe cleaned	40.13
Total cost	$342 32
Average cost per mile of pipe	8 96

During the past year the Division has revised, to a large extent, specifications covering supplies required by the Department and, in many instances, has extended these specifications to cover engineering materials formerly purchased by brand or in the open market.

We are also revising several of the departmental records and standardizing procedure in the permanent divisions. It is hoped to extend this class of work so that eventually this Division will act as a "Bureau of Economy and Efficiency," through its investigations into improved methods of construction and operation and into modern tools, apparatus and appliances for expediting the work.

Yours respectfully,

ROBERT L. CLEMMITT,
Assistant Water Engineer.

REPORT OF CONSTRUCTION DIVISION

BALTIMORE, December 31, 1913.

MR. EZRA B. WHITMAN, *Water Engineer.*

DEAR SIR—I am enclosing you herewith my report of work done by the Construction Division for the year 1913.

This Division has been engaged during the year in the construction and repairing of all fixtures, mains and piping owned or controlled by the Water Board, consisting of the laying of all extensions of mains and the connections thereto; the installation of services, meters, hydrants, blows and fountains; the maintenance of and repairs to mains, services, hydrants and fountains.

The Division has during the year done a great deal of work in the way of laying mains in advance of improved paving, which has been carried on by the Paving Commission, the Commissioners for Opening Streets and the State Roads Commission; one of the most expensive of these jobs being the lowering of the 12-inch and 30-inch mains on Reisterstown road, which necessitated a cut into a rock bed at some points nine feet deep, to conform to the new grade established by the State Roads Commission; the total cost of the work done during the year in advance of improved paving being $154,183.16.

We have also done considerable work for the Sewerage Commission, consisting of the moving of our mains out of the way of sewers and the moving of a number of our mains around their manholes; also, we have made for them 575 one-inch taps on our mains for the purpose of a supply to their manholes.

Quite a large part of our force have been kept most of the year at Mount Royal Pumping Station, laying mains and making 30-inch, 36-inch and 48-inch connections, necessitated by the installation of the new pump at Mount Royal Pumping Station.

During August of this year we installed a 36-inch valve at Eutaw Place and North avenue, which necessitated the shutting down of the 36-inch force main.

We have installed during the year 3,256 flat-rate services, at a loss of $2,896.52; a portion of this loss was due to the system of manifold services installed in advance of improved paving opposite unimproved lots and also where rows of houses were built on streets paved with improved paving, we having made only two cuts in the paving and running the supply pipe inside and parallel with the curb.

Owing to the great amount of new and repair work that we have been called upon to do this year, there has been quite a scarcity of of labor; this condition probably being due to the great amount of work being done by other departments and contractors in the city during the year.

The amount of work done by this Division which was billed against other departments, contractors and consumers, was $50,558.99, which is about a 40 per cent. increase over the previous year.

I am pleased to report that the employees of this Division, whose number comprise a majority of those in the Department, have performed their duties in a manner which has been thoroughly satisfactory.

I submit herewith details of the work of this Division, with tables showing cost of labor and material under the headings of the various charge accounts of the Division.

Respectfully submitted,

GEORGE R. TRUELOVE,
Superintendent Construction Division.

REPORT OF MECHANICAL DIVISION

BALTIMORE, January 22, 1914.

MR. EZRA B. WHITMAN, *Water Engineer.*

DEAR SIR—I herewith respectfully submit my report of work of the Mechanical Division for the year ending December 31, 1913:

WATER PUMPED.

Western Pumping Station:

To Western Upper Service, 518,005,223 gallons; cost per 1,000 gallons, 1.97 cents.

To Eastern Upper Service, 173,447,368 gallons; cost per 1,000 gallons, 2.67 cents.

Coal hauled from railroad siding to boiler-room coal bin, 25 cars; weight of coal, 2,455,600 pounds.

Eastern Pumping Station:

To Eastern High Service, 3,397,902,152 gallons; cost per 1,000 gallons, 0.835 cents.

To Middle Service, 1,015,080,848 gallons; cost per 1,000 gallons, 0.813 cents.

Coal hauled from coal trestle to boiler-room, 158 cars; weight of coal, 16,100,380 pounds.

Mt. Royal Pumping Station:

To Western High Service, 6,900,883,489 gallons; cost per 1,000 gallons. 0.573 cents.

To Middle Service, 2,038,890,552 gallons; cost per 1,000 gallons, 0.623 cents.

Coal unloaded, 238 cars; weight of coal, 24,890,700 pounds.

COAL UNLOADED ON RAILROAD SIDINGS.

Druid Hill Park, 25 cars; weight of coal	2,455,600 pounds
Gay Street Yard, 158 cars; weight of coal	16,103,800 pounds
Mt. Royal Pumping Station, 238 cars; weight of coal	24,890,700 pounds

CAST-IRON PIPE AND FITTINGS.

Inspected and supervised hauling by Supt. of Hauling:	No.	Weight, lbs.
Lengths 3″ cast-iron pipe	500	96,492
Lengths 4″ cast-iron pipe	644	169,905
Lengths 6″ cast-iron pipe	6,500	2,637,550
Lengths 8″ cast-iron pipe	317	179,506
Lengths 10″ cast-iron pipe	550	426,274
Lengths 12″ cast-iron pipe	344	345,054
Lengths 16″ cast-iron pipe	135	235,726
Cast-iron pipe fittings	2,008	336,359

MACHINE SHOP.

Fitted up 1½″ piston post.
Fitted up one hand pump.
Fitted up twenty-five 4″ hydrant screws.
Fitted up twenty-five 5″ hydrant screws.
Fitted up sixteen 3″ tapping valve bodies.
Fitted up twenty-three 4″ tapping valve bodies.
Fitted up two hundred and fifty 6″ tapping valve bodies.
Fitted up eighty-four 2″ valve bodies.
Fitted up sixty-eight 3″ valve bodies.
Fitted up sixty-four 4″ valve bodies.
Fitted up nine hundred and eight 6″ valve bodies.
Fitted up ten 10″ valve bodies.
Fitted up twelve 1″x4½″ brass clamp bolts.
Fitted up twenty-six double streamer bonnets.
Fitted up two hundred and forty-three single streamer bonnets.
Fitted up fifty-eight 2″ Department valve bonnets.
Fitted up fifty 3″ valve bonnets.
Fitted up one hundred and one 4″ valve bonnets.
Fitted up seven hundred and fifty-nine 6″ valve bonnets.
Fitted up nine 10″ valve bonnets.
Fitted up sixty-two 4″ plug cover bottoms.
Fitted up sixty-five 5″ plug cover bottoms.
Fitted up seventy-five 2″ stuffing boxes.
Fitted up one hundred and fifty-two 3″ stuffing boxes.
Fitted up one hundred 4″ stuffing boxes.
Fitted up five hundred and sixty-seven 6″ stuffing boxes.
Fitted up ten 10″ stuffing boxes.
Fitted up twenty-five single streamer coupling caps.
Fitted up one hundred and ninety-four single streamer nozzle caps.
Fitted up twenty-five 4″ large fire hydrant caps.
Fitted up twenty-five 5″ large fire hydrant caps.
Fitted up one hundred and seventy-two 6″ single streamer hydrant caps.
Fitted up three old style fire hydrant large caps.
Fitted up one hundred and twenty-two old style fire hydrant small caps.
Fitted up ten 10″x4″ tapping clamps.
Fitted up thirteen 10″x6″ tapping clamps.
Fitted up two 12″x4″ tapping clamps.
Fitted up five 12″x6″ tapping clamps.
Fitted up five 16″x6″ tapping clamps.

Fitted up nineteen 20″x6″ tapping clamps.
Fitted up one 36″x12″ tapping clamp.
Fitted up one 40″x8″ tapping clamp.
Fitted up two hundred and ninety-five single streamer couplings.
Fitted up twenty-one Worthington dial covers.
Fitted up fifty-five 4″ plug covers.
Fitted up twenty-nine 5″ plug covers.
Fitted up eighteen 5″ ferrule plug covers.
Fitted up nine 3″ flanges.
Fitted up two hundred and forty-six single streamer bonnet glands.
Fitted up seventy-five 2″ glands.
Fitted up one hundred and fifty 3″ glands.
Fitted up seventy-five 4″ glands.
Fitted up five hundred and ninety-two 6″ glands.
Fitted up ten 10″ valve glands.
Fitted up twenty-five double streamer valve guides.
Fitted up two hundred and ninety-one single streamer valve guides.
Fitted up two pump valve guides.
Fitted up two hundred and forty-five single streamer fire hydrants.
Fitted up one mandrel.
Fitted up two hundred and forty-nine large streamer nozzles.
Fitted up two hundred and forty-nine small streamer nozzles.
Fitted up two hundred and eighty-six single streamer opening nuts.
Fitted up two hundred and twenty-four single streamer valve rod nuts.
Fitted up seven hundred and twenty-five 6″ valve nuts.
Fitted up one hundred and twenty-five streamer lock nuts.
Fitted up fifty Union meter gear pins.
Fitted up fifty Union meter yoke bearing pins.
Fitted up two hundred and fifty 6″ streamer coupling pins.
Fitted up seven 20″ pinions for Chapman valves.
Fitted up one 20″ valve pinion.
Fitted up two 4″ Gem meters, piping (B. & O. R. R.).
Fitted up one piston for coal conveyer (Mt. Royal Pumping Station).
Fitted up fifty-one valve plates.
Fitted up twenty-five 6″ single streamer bonnet plates.
Fitted up one hundred and twenty-four single streamer coupling plates.
Fitted up one hundred and seventy-five single streamer valve plates.
Fitted up sixty-five 2″ valve plugs.
Fitted up sixty-seven 3″ valve plugs.
Fitted up one hundred 4″ valve plugs.
Fitted up seven hundred and forty-eight 6″ valve plugs.
Fitted up eleven 10″ valve plugs.
Fitted up six 1″ Union meter posts.
Fitted up two 1½″ Union meter posts.
Fitted up four hundred and eighty-six streamer valve rods.
Fitted up forty-seven rosettes for fountain.
Fitted up fifty 4″ old style fire hydrant screws.
Fitted up twenty-five 5″ old style fire hydrant screws.
Fitted up eighty single streamer valve screws.
Fitted up three hundred and seventy-five streamer opening screws.
Fitted up two 16″ Pratt & Cady valve screws.
Fitted up fifty 2″ valve screws.

Fitted up one hundred and thirty-eight 3″ valve screws.
Fitted up one hundred and fifty-nine 4″ valve screws.
Fitted up six hundred and twenty-four 6″ valve screws.
Fitted up twenty-four 10″ valve screws.
Fitted up one 16″ Ludlow valve screw.
Fitted up two 20″ Chapman valve screws.
Fitted up one hundred and forty 2″ Department valve seats.
Fitted up one hundred and twenty-one 3″ Department valve seats.
Fitted up two hundred and fifty 4″ Department valve seats.
Fitted up one thousand three hundred and fifty-six 6″ valve seats.
Fitted up forty-two 10″ valve seats.
Fitted up twelve double streamer valve seats.
Fitted up one hundred 6″ tapping valve seats.
Fitted up two hundred and seventy-five single streamer valve seats.
Fitted up one hundred and seventy-five streamer drip valve seats.
Fitted up three bubble spigots.
Fitted up twelve fountain spigots.
Fitted up one hundred and two single streamer drip rod springs.
Fitted up one hundred and sixty-three single streamer hydrant springs.
Fitted up fifty 1½″ meter spuds.
Fitted up one hundred and ninety-one standpipes.
Fitted up eleven 3″ meter strainers.
Fitted up nine fountain straps.
Fitted up twenty-one 10″ Department valves.
Fitted up six hundred and thirty-three 6″ Department valves.
Fitted up eighty-six 4″ Department valves.
Fitted up sixty-seven 3″ Department valves.
Fitted up thirty-six 2″ Department valves.
Fitted up fifty-six 6″ tapping valves.
Fitted up fifty-seven 5″ plug cover tops.
Fitted up sixty 4″ plug cover tops.
Fitted up two hundred and eighteen single streamer tail pipes.
Fitted up twenty-five single streamer drip valves.
Fitted up thirty-eight double streamer wrenches.
Fitted up fifty single streamer wrenches.
Fitted up eight ⅞″x3⅝″ brass tapping clamp bolts.
Repaired thirty-eight department automobiles.
Repaired one motorcycle (City Engineer's Department).
Altered six 12″ tapping valves.
Made two axes.
Tapped two 4″ caps to 1½″ hole (Construction Division).
Tapped one 6″ cap to 1″ hole (Construction Division).
Tapped one 8″ cap (Construction Division).
Tapped and threaded one 2″ hole in 48″ cap (Ensor st. and North ave.).
Tapped seventeen 1″ holes in 2″ cap (rear 1021 Beechwood ave. and Construction Division).
Tapped and bored one 2″ hole in 2″ cap.
Tapped two 3″ caps to 1″ hole (Construction Division).
Tapped and bored fifty 1½″ caps to ¾″ hole (Construction Division).
Tapped and drilled two hundred and eleven 1½″ caps to 1″ hole (Construction Division).

Tapped and drilled nine hundred and three 1½″ caps to ¾″ hole (Construction Division).
Tapped and drilled two hundred and sixty-two 1½″ caps to 1″ hole (Construction Division).
Moulded six hundred and seventeen lead meter seals.
Repaired four 8″x6″ clamps (Construction Division).
Repaired two 10″x4″ clamps (Construction Division).
Repaired one 16″x6″ clamp (Construction Division).
Made four 20″ female clamps (Construction Division).
Repaired one 20″x6″ tapping clamp (Construction Division).
Repaired twenty-four fountains.
Repaired one street washer (Construction Division).
Repaired five 4″ fire hydrants (Construction Division).
Repaired fourteen 5″ fire hydrants (Construction Division).
Repaired one hundred and eighty-three 6″ fire hydrants (Construction Division).
Repaired ninety-one 8″ fire hydrants (Construction Division).
Repaired one Ludlow hydrant (Construction Division).
Repaired two feed pumps.
Repaired one pump (Loch Raven).
Special repairs to No. 10 Pump (Mt. Royal Pumping Station).
Repaired nine market plugs.
Repaired one 5″ plug (Construction Division).
Repaired one 3″ valve plug (Lafayette ave., north of Druid Hill ave.).
Repaired two 8″ valve glands (Western Pumping Station).
Repaired one 3″ Crown meter.
Repaired one ¾″ Empire meter.
Repaired three 3″ Gem meters.
Repaired three 4″ Gem meters.
Repaired one ¾″ Hersey meter.
Repaired five 1½″ Hersey meters.
Repaired three 2″ Hersey meters.
Repaired one 3″ Hersey meter.
Repaired one ⅝″ Keystone meter.
Repaired seven ¾″ Keystone meters.
Repaired one hundred and one ⅝″ King meters.
Repaired forty-one ¾″ King meters.
Repaired six 1″ King meters.
Repaired one 1½″ King meter.
Repaired one 2″ King meter.
Repaired forty-three ⅝″ M. F. meters.
Repaired three ¾″ M. F. meters.
Repaired seven 1″ M. F. meters.
Repaired one 2″ Torrent meter.
Repaired thirteen 3″ Torrent meters.
Repaired eight 4″ Torrent meters.
Repaired three 6″ Torrent meters.
Repaired four 1½″ Trident meters.
Repaired two 2″ Trident meters.
Repaired one hundred and one ¾″ Union meters.
Repaired thirty-two 1″ Union meters.
Repaired thirty-one 1½″ Union meters.

Repaired one 1″ Worthington meter.
Repaired one 2″ Worthington meter.
Repaired one 1½″ Worthington meter.
Repaired two 3″ Worthington meters.
Repaired three 4″ Union meters.
Repaired forty 2″ Union meters.
Repaired eleven 3″ Union meters.
Repaired five oil pumps.
Repaired two ram pumps (Eastern Pumping Station).
Repaired vacuum pump (Western Pumping Station).
Made one guard for valve stem.
Made one valve stem.
Repaired two 4″ plug stems.
Made one 5″ plug stem.
Repaired one 16″ valve screw.
Sharpened and ground four thousand nine hundred and ninety-one tools.
Repaired valves (Mt. Royal Pumping Station).
Repaired one valve.
Repaired thirty 4″ valves.
Repaired thirty-one 6″ Department valves.
Repaired four 10″ valves.
Repaired one 16″ valve.
Repaired eleven 20″ valves.
Repaired two 30″ valves.
Repaired one 36″ Ludlow valve.
Repaired one 30″ Chapman valve.
Repaired nineteen 2″ Department valves.
Repaired twenty 3″ Department valves.
Repaired one 10″ A. P. Smith valve (Dolphin st. and Tiffany alley).
Repaired five 6″ tapping valves.
Repaired one 3″ Pratt & Cady valve.
Repaired one 48″ Pratt & Cady valve.
Repaired one 36″ by-pass Ludlow valve.
Made four lead cylinders (Engineering Division).
Made one 2″x3″ lead cylinder (Municipal Laboratory).
Set up one 36″ cutting machine.
Made four jacks.
Tapped one 6″ pipe, 1″ corporation cock.
Reamed one corporation cock (Construction Division).
Repaired three tapping machines (Construction Division).
Repaired three locks.
Repaired one electric lamp.
Repaired one jig.
Repaired two governors.
Repaired two chain falls.
Repaired Engine No. 839.
Repaired pump cylinders.
Repaired coal crusher.
Repaired coal conveyer (Mt. Royal Pumping Station).
Repaired hose connection.
Repaired air compressor (Eastern Pumping Station).
Drilled liners for furnace doors (Eastern Pumping Station).
Drilled one flange (Mt. Royal Pumping Station).
Drilled three grate bar frames.

Drilled one hundred and eighty-eight conveyer wheels (Mt. Royal Pumping Station).
Made one bolt (Loch Raven).
Made one mandle.
Made four wrenches.
Made eight bolts and rings.
Made seven links.
Made one ring.
Made thirty-one 1¼″ bolts (Loch Raven).
Bored and bushed three 18″ pulleys (G. O. E. Division).
Tapped five 4″ plug rods.
Tapped one 5″ plug rod (Construction Division).
Repaired Boiler No. 4.
Alterations to front for new stokers.
Repaired twelve wrenches.
Repaired boiler plates and hose.
Repaired electric wiring.
Repaired three shafts.
Repaired one spigot.
Repaired three scrapers.
Repaired two bonnet reamers.
Repaired one lathe rack.
Repaired lubricator and heater plates.
Repaired two end mills for valve seats.
Made one end mill for chasing seats.
Made three cube molds.

CARPENTER SHOP.

Made eight hundred hubs (G. O. E. Division).
Made nine thousand two hundred stakes (G. O. E. Division).
Made one hundred and forty-four 5′ wood stop boxes (Construction Division).
Made eleven 2′ wood stop boxes (stock).
Made two thousand and seventy-five 3′ wood stop boxes (stock).
Made twenty-four 6″ pipe plugs (stock).
Made eighty-eight 3″ pipe plugs (stock).
Made ninety-two 4″ pipe plugs (stock).
Made thirty 4′ wood stop boxes (stock).
Made one 16′ pole for coal cart.
Made twelve concrete watering troughs.
Made one hundred 2″ ferrule poles (Construction Division).
Made five tool boxes (Construction Division).
Made three vice boards (Construction Division).
Repaired coal bins (Eastern Pumping Station).
Repaired one step ladder (Mt. Royal Pumping Station).
Repaired nine tool boxes (Construction Division).
Repaired one hundred and fifty-nine tools (Construction Division).
Repaired doors (Old City Hall).
Repaired doors and window frames (Mechanical Division).
Repaired watering trough frames (Mechanical Division).
Sharpened thirty-two saws (Construction Division).
Erected platform for coal sampling (Mt. Royal Pumping Station).
Made watch box (Gunpowder Supply Improvement Division).
Miscellaneous covered gate, stand and railings.

PATTERN SHOP.

Cut one gasket.
Completed hypochlorite plant (Montebello).
Altered pump driver (hypochlorite plant, Montebello).
Altered one desk drawer (Engineering Division).
Fitted up three stadia rods (G. O. E. Division).
Furnished two gear pinions (hypochlorite plant, Montebello).
Miscellaneous carpentering for Water Engineer's office.
Repaired porch (Loch Raven).
Repaired flooring, shutters and pump (Guilford Reservoir).
Repaired bottom on drawing board (Hirshberg Art Company).
Made case for "U" tubes.
Repaired drawing board.
Made one form (Gunpowder Supply Improvement Division).
Repaired one hundred and twelve patterns.
Repaired window frames (Construction Division).
Made ventilation pipes in windows (Auditor's office, W. D.).
Repaired one fountain (Construction Division).
Made one lubricator pattern.
Made twenty-nine patterns.
Made one pattern (Western Pumping Station).
Made four portable watch boxes.
Made four drawers.
Made three 48″ gaskets (Loch Raven).
Made four 24″ gaskets (Loch Raven).
Made fifty-seven rammer handles (Construction Division).
Made one thousand one hundred and fifty hubs (G. O. E. Division).
Made two wooden mauls.
Made twelve stop planks (Loch Raven).
Made one hundred and seventy-four ferrule poles.
Made one pattern for vacuum pump.
Made four trestles.
Made one white pine cord box.
Made two core boxes (charged to Kugler & Shane).
Made one thousand one hundred ¾″ ferrule plugs.
Made three hundred and sixteen pine plugs.

BLACKSMITH SHOP.

Repaired one carriage (Construction Division).
Repaired horse hames (stable, Gay Street Yard).
Repaired five chains for harness (County Division).
Repaired one coal cart (Eastern Pumping Station).
Repaired one wheelbarrow (Eastern Pumping Station).
Repaired five drip rods (general stores).
Repaired and sharpened twenty-eight lamp stands (Construction Division).
Made twelve 12″ hose clamps (Construction Division).
Made one hundred 4″ ferrule clamps (Construction Division).
Made ten 10″ female clamps (Construction Division).
Made ten 12″ female clamps (Construction Division).
Made seven ¾″x27″ bolts (Loch Raven).
Made twelve ¾″x2″ iron rings (Eastern Pumping Station).
Pieced four ⅝″ bolts (Construction Division).

Forged four pump rods (Eastern Pumping Station).
Forged four collars (Eastern Pumping Station).
Forged one hundred and twenty-four header plate bolts (Eastern Pumping Station).
Forged seventy-eight manhole plate bolts (Eastern and Western Pumping Stations).
Forged four ⅞″x26″ bolts (Mt. Royal Pumping Station).
Forged on crank handle (Mt. Royal Pumping Station).
Forged five brackets (Mt. Royal Pumping Station).
Forged eighteen eye bolts (Mt. Royal Pumping Station).
Forged two trace clamps (stable, Gay Street Yard).
Forged twenty-two open links (stable, Gay Street Yard).
Forged two iron skids for auto truck (Construction Division).
Dressed and sharpened thirteen thousand six hundred and seventy-six tools (Construction Division).
Cut eight pieces ¾″ iron, 18″ long (Construction Division).
Put on one hundred new horseshoes (County Division).
Replaced forty old horseshoes (County Division).
Put on one thousand two hundred and six old horseshoes (Construction Division).
Replaced five hundred and ninety-six old horseshoes (Construction Division).
Put on seventy-one old horseshoes (Mechanical Division).
Replaced sixty old horseshoes (Mechanical Division).

The number of valves and hydrants manufactured this year, the pipe and fittings handled and special work done has been far in excess of that in previous years. Considerable of this was due to improved paving and new sewers. Quite an additional amount of work has been placed on this Division in the repairing, overhauling and painting of automobiles, not only for the Water Department, but for the various departments of the city government, and with very satisfactory results. Our facilities for this, however, are not very good and I would respectfully suggest that a fireproof building, possibly with iron framework and corrugated sides, be provided, where the machines can be dismantled and repaired, and with a dust-proof section therein, to be used as a paint shop.

Western Pumping Station.

The station has been in operation for the full twelve months. Pumps Nos. 46 and 90 were overhauled, but you will understand that no radical work was done on account of jeopardizing the Upper Services. In order to better the conditions, so that a pump might be taken out of service and yet neither the Western Upper Service nor the Eastern Upper Service sacrificed, a 6-inch by-pass, hand controlled and provided with pressure gauges, was installed between the Western Upper Service and the Eastern Upper Service discharge mains outside the respective check valves. This by-pass served its purpose well and has proven to be a good investment. It was installed on July 1, 1913.

During the year considerable trouble was experienced, and fast becoming serious, with the discharge mains outside the station, due to movement of fittings and valves and constant leakage. Conditions became so bad that on October 31 work was started on the renewal and replacement of the entire work. All the work was done between the hours of shutting down at night and starting up in the morning, using one pump for both services with the 6-inch by-pass as the supply to the Roland Standpipe. The entire work was done without stopping the service, either to the West Arlington or the Roland Standpipes, and I cannot but help expressing my appreciation for the co-operation of the Construction Division to this end. While the station was not out of service at any time, yet for a period of five hours (from 10 A. M. to 3 P. M.) on March 28 we could not pump to West Arlington Standpipe, due to trouble experienced by the Construction Division while making some repairs at Park Heights avenue and Third street.

The steam ends of both pumps are in good condition, except for minor repairs to valve gears, etc. The water ends show about the same as they did a year ago. The three National water-tube boilers are in good condition and have given good service. The Atlas boiler has not been used, there having been no occasion therefor. Most of the auxiliary equipment has been overhauled and has given good service.

Eastern Pumping Station.

This station has been in operation the entire year, with the exception of approximately eight hours, when it was shut down to renew the worst of the blowing steam joints. The main steam piping has been a source of annoyance for the entire year. Plans are being prepared for a new steam header in the boiler-room. Considerable work has been done on Pumps Nos. 839 and 1207. This was done, however, without shutting down the plant and without dismantling a pump to such an extent that it could not have been gotten back into service within eight or nine hours in case of an emergency. At the beginning of the year the slip, which had gradually increased, had reached the approximate figure of about 30 per cent. for Pump No. 1207 and 25 per cent. for Pump No. 839.

About 75 per cent. of the valve seats in Pump No. 1207 have been replaced with Boyd turbine valve seats and the slip has been reduced from 30 per cent. to approximately 5 per cent. The new valve seats and valves show up well after six months' wear. The sixteen steam and exhaust valve stems were repaired. The primary water heater was retubed and housing studs were made and placed. Repairs were started on the reheaters on Pump No. 1207, but not completed, as the pump had to be put back into service.

All valve seats in the water end of Pump No. 839 were replaced by the valve seats taken from Pump No. 1207, after said seats were faced off and put into good condition. The percentage of slip has been decreased from 25 per cent. down to 8 per cent. The condenser was overhauled and many of the tubes renewed.

New joints were made on the reheaters and the exhaust pipe to overcome leaks which were destroying the vacuum.

Considerable old and dead pipe has been removed from the basement of the Pumping Station. Considerable work has been done towards new exhaust lines and the connecting up of the Cochran feed-water heater. There remains, however, considerable work to be done.

The superheating and bottom row of tubes in Boiler No. 2 were renewed and a new header, superheating tubes and bottom tubes were renewed in Boiler No. 1. Boiler No. 4 was retubed and was provided with a Steinman underfeed stoker for test and approval, but did not prove satisfactory. This stoker, however, is being rebuilt at the present writing at the expense of the contractor. One very good feature, however, in connection with it is the shaking grate, and I would advise the adoption of the shaking grates for the other boilers in the station and also No. 4, should the stoker not prove satisfactory. A cracked header in Boiler No. 3 was replaced. In this boiler, for the same reason, a new front saddle header was installed.

A Dean duplex outside-packed plunger boiler feed pump was purchased and installed and has given good service.

Mount Royal Pumping Station.

The most notable thing at this station during the year was the starting up of the new B. & W. boilers and Pumping Engine No. 10. This work was installed under the supervision of the Assistant Water Engineer and all tests made were conducted by his force. The pump has been running for some time, but not up to full speed, due to construction work exterior to the station.

A break occurred in one of the "Y" branches on pump discharge header in the pipe vault. An endeavor was made to provide a temporary repair while making preparation to install a new fitting, but this was not successful. Fortunately, however, a "Y" fitting previously removed and intended for scrap had been held at the yard for emergency purposes, which, when checked, was found suitable. This fitting was used to replace the one broken. Water stored in the reservoirs, with that delivered from the Eastern Pumping Station, took care of the consumption during the period of making repairs.

Equipment at this station overhauled during the year was as follows:

Conveyer engine drive, new gears, etc.

Coal crusher, renewal of crushing rolls and repaired hopper.

Coal-conveyer, overhauled and curves reset.

Coal bunkers, new 6-inch tie beams placed.

Reheater Engine No. 1208, retubed.

Stoker engine, overhauled and gears renewed.

Coal scales, repaired track and platform.

Dynamo Engine No. 2, overhauled. In this connection would say that one end of crank pin was found loose. The shaft was taken to the shop and repaired. I am afraid, however, that a new crank shaft will have to be provided, as there is evidence that the crank pin is again coming loose.

A large part of the electric wiring has been renewed, as the insulation thereon had broken down and was a constant source of trouble, due to grounds and short circuits. In the boiler and conveyer rooms considerable of the wiring was renewed and locations changed on account of the rearrangement of the old boilers and the installation of the new ones.

The gas pipes in the station, which at the time of construction of the building were placed in the floors, were found to have developed leaks, and it was deemed advisable to renew most of them. The new pipes are exposed, so that in the future should leaks occur they can be readily located and repaired.

With the rearrangement of the old boilers and the installation of the new boilers, a new steam main was installed under contract, and after the same was in operation the old steam mains and their parts were removed and taken to Gay Street Yard and are there held subject to your disposal.

A water motor and fan, which had long been at Gay Street Yard, was connected up for providing purer air in the crusher room. This crusher room, by the way, you will understand is nothing more than a deep pit under the coal-unloading tower. In the summer time, with the heat radiated from the crusher engine cylinders and the coal dust and no air circulation, it is very hard on the men while unloading coal. This water motor is only in operation at such times when coal is being unloaded.

The hydraulic valve operator made by the Hydraulic Valve Operating Company was installed on the suction valve of Pump No. 1209, and for purpose of trying out a temporary connection for the supply and waste therefrom was provided.

In the sub-basement adjacent to the new pump two radiators have been installed.

Due to considerable trouble having been experienced with the air compressor of Pumps Nos. 1208 and 1209, and the same being inefficient, a Westinghouse air compressor was installed, as was also an air line to the new pumping engine.

The old Holly pipe lines, which were abandoned at the time of installing the new steam main, were also removed.

The boiler blow-off line outside of the building, and between it and the discharge well to sewer, had become a constant source of annoyance by reason of leaks which caused constant settlement of the pavement. This blow-off line has been taken out and renewed.

The furnace brick work in the new B. & W. boilers, which are equipped with Taylor stokers, has been renewed. This was caused mainly by the excessive clinkering of our coal.

The new coal stack scales, provided with new boiler installation, were erected.

New stacks on the old scales have also been placed.

A new ash chute has been placed under Boiler No. 6, as has also a new ash chute under the arch leading from the tower ash bin.

A new steam connection from the new steam main to the stoker engine of Boiler No. 8 has been installed.

A drip line for a part of the new steam header was found necessary, and has been provided.

A platform on top of the new boiler flue was found necessary. It has been placed to provide ready access to engine operating the scrapers of the Green economizer.

The Burt oil filter has been erected and put into use.

The wash bowls in the engineers' toilet and oilers' toilet have been renewed. Not only were the old marble slabs broken, but the bowls also, and each had been patched from time to time in past years.

On November 13, at approximately 5 A. M., an accident occurred to Pumping Engine No. 1208 by the breaking of a piston ring, a part of which dropped down into the exhaust port of the high pressure cylinder (east side) causing a part of the annular flange of the piston to be broken off. A part of this also passed into the exhaust port and either one or both of the broken pieces became locked between the rotary valve and the port. This stalled the valve and with it the valve stem, preventing it from turning. Now, as the reach rod of the valve could not rotate the stem it pushed it to one side and bent it and the journal casting in which the stem rotates was broken. This journal casting, by the way, acts as a bonnet for the valve chamber and is provided with a stuffing box and two journals for the valve stem. In this connection, I might say that it is remarkable that no greater damage was done. As this pump was thus put out of service it has been practically dismantled for overhauling. All work in connection with the overhauling that it is possible for the Department to do, and for which it is equipped, has been started.

Gay Street Yard.

A No. 2 Landis bolt cutter for bolts and pipe has been installed and has given very good satisfaction. There has also been purchased for the tool room a set of 48-fluted hand reamers with square shank—these were found to be extremely necessary. An additional lead furnace has been installed to facilitate the assembly of valves and hydrants.

The employees of the various divisions have been faithful in the performance of their work. The changes made in the personnel, of which you are aware, have proven beneficial.

Very respectfully,

A. O. Babendrier,
Superintendent Mechanical Division.

REPORT OF COUNTY DIVISION

BALTIMORE, December 31, 1913.

MR. EZRA B. WHITMAN, *Water Engineer.*

DEAR SIR—The rainfall on the Jones Falls supply was 38.39 inches.

The water in Lake Roland was too muddy to use for 22 days and was below the dam 169 days; the maximum flow was +1.05 on March 27 and the minimum —5.80 on July 28; 79.88 tons of hyphochlorite of lime were used in purifying the water.

Realized from the sale of hay, wood, etc., $943.62.

The Jones Falls conduit continues in good order; 119.59 tons of alum were used at Harpers Waste Weir in clarifying the water.

The maximum water in Hampden Reservoir was +0.5 on July 22 and December 24, the minimum —10.4 on April 18. In May, when Lake Roland was shut off, complaint was made by the Melvale Distillery of slack supply. This lake was shut off from Druid Lake and filled with untreated water, and before Druid Lake was again connected it was treated with 700 pounds of hypochlorite in its dry state by scattering it from a boat.

The maximum water in Druid Lake was —0.3 on December 24 and the minimum —10.7 on April 19. The railing was damaged six times during the year by automobiles. In each case where the license number could be obtained, the repairs were made and bills rendered to the owners.

The rainfall on the Gunpowder supply was 36.76 inches.

The water in Loch Raven was too muddy to use for 72 days and was below the dam 287 days. This was largely due for the accommodation of the contractor who was constructing the new dam. The maximum flow was +2.8 on March 27 and the minimum —10.7 on May 22. Several of the farms purchased for the construction of the Gunpowder improvements have been leased at a nominal rental with the object of getting them set in grass. Ninety-four thousand eight hundred and forty-five young trees of the following varieties were purchased and set in the nursery: 4,000 tulips, 2,000 yellow locusts, 2,000 catalpa spesioses, 2,845 sugar maples, 64,000 white pines, 9,000 Norway spruces, 5,000 hemlocks, 4,000 shagbark hickories, 2,000 black cherries. Twenty-six thousand seven hundred and eighty-six trees were transplanted to high ground at the upper end of the loch (3,775 tulips, 3,857 locusts, 5,600 black walnuts, 3,931 oaks, 2,473 white ash, 2,013 catalpa spesioses, 3,596 sugar maples, 766 shagbark hickories and 775 black cherries). One thousand three hundred as follows were purchased and set in nursery for future street planting: 500 elms, 500 white ash, 300 Norway maples and 200 Oriental planes. Cost of forestry stock, $786.25; labor, $2,290.50. Cost of street stock, $223; labor, $281. Realized from rent, wood, etc., $2,425.34.

The maximum water in Lake Montebello was +1.1 on March 6 and the minimum —20.7 on August 5. The hypochlorite plant was put in operation early in January, 119.59 tons of hypochlorite and 1,135.62 tons of alum were used in treating the water. Realized from the sale of hay, bags, etc., $371.95.

On July 11, Major William L. Kenly, formerly Water Engineer and one of the oldest employees of the Department, died at his residence at this lake.

The maximum water in Lake Clifton was +0.3 on December 15 and the mimimum —18.5 on April 19.

The maximum water in Guilford Reservoir was +0.6 on May 19 and the minimum —5.35 on September 22. The riprapping on the south slope is badly out of line and should be repaired.

The maximum water in Western High Service Reservoir was +0.6 on August 2 and the minimum —6.9 on September 9. Several complaints have been made by the Park Department about slack supply at the Mansion House in Druid Hill Park. I recommend that a tap be made from the Upper Service for this supply.

The maximum water in Lake Ashburton was —0.4 on July 16 and the minimum —8.8 on December 13. This reservoir and the grounds adjacent to the keeper's house are still in an unfinished condition, nothing having been done to them during the year.

The buildings and grounds of the standpipes are in good order, except the trouble house at West Arlington, which needs painting.

Our Water Shed Inspector made 904 sanitary inspections during the year and 21 abatements of nuisances were secured.

There were 54 typhoid cases reported. The samples of water taken for analysis showed 40 to be bad, 4 good, 8 used Baltimore county water, 1 was not on the shed and 1 where the occupant refused to allow the Inspector to take a sample.

Respectfully submitted,

William Benthall,
Superintendent.

TABLE OF RAINFALL, IN INCHES—1913.

REPORT OF FILTRATION DIVISION

Mr. Ezra B. Whitman, *Water Engineer.*

Dear Sir—In compliance with your request, I take pleasure in submitting the following report for work done by the Filtration Division during the year 1913:

Contracts Let.

Plans and specifications were prepared and nine different contracts (Nos. 9, 11, 12, 13, 14, 18, 19, 20 and 21) for work in connection with the Montebello filters were awarded. A more detailed statement regarding each of these contracts is given below.

Contract No. 9—Railroad.

In order to secure an easy means of hauling sand and gravel for construction purposes, it was planned to have the United Railways Company build a spur track around the lake drive, which would connect their Harford Avenue Line with the filtration plant. An informal agreement was made with them to do the work on a percentage basis, but on submitting the matter to the Board of Awards for approval they decided that it would be necessary first to advertise and then award the contract for this work in the usual manner. Three bids were opened on February 26, 1913, on plans and specifications prepared by this Division. Malcolm W. Hill & Company of Baltimore were the lowest bidders, and the contract was awarded to them for $11,555. According to contract, the road was to have been completed by April 19, 1913, but owing to a number of causes for which the contractors were in no way to blame the road was not sufficiently completed for hauling sand and gravel until June 3, 1913.

Contract No. 11—Filters, Basins and Grading.

Plans and specifications were originally prepared for this contract, which contemplated the building and equipping of the filters and the various basins to be used in preparing the water for filtration. There were three bids opened on April 30; that of the Keystone State Construction Company of Philadelphia for $971,187.41 being the lowest. The New York Continental Jewell Filtration Company bid $982,563.05 and Oscar Daniels and Company of New York City bid $1,016,525.60. The lowest of these prices was so much higher than our estimate that it was decided to reject all bids. The contract was then sub-divided. The earth work, concrete and such portions of the construction as it became necessary to build in connection with the concrete were formed into a separate contract and readvertised as Contract 11. That the changed form proved attractive to contractors was shown by the ten bids which were opened on June 4; the lowest being that of Stewart-Jones Company and Claiborne, Johnston & Company of Baltimore for $396,895.65. The contract was awarded to them.

A comparison between the bid of Stewart-Jones Company and Claiborne, Johnston & Company and the lowest previous bid of the Keystone State Construction Company showed that on the portion of the work awarded under Contract 11, upon which an accurate comparison could be made, the city saved $179,385. Owing to the fact that in the rejected bids for filter equipment, Item 25 contained a number of distinct elements which were grouped together under one lump sum, it was not possible to determine the full saving. The Keystone State Construction Company bid $385,000 for this item, a portion of which was afterward awarded under Contracts 11, 12, 13 and 14. Considerable additional saving was made on the last three contracts, which were for sluice gates, valves and cast-iron pipes and specials, but the amounts are not known.

By mutual agreement among the contractors the Stewart-Jones Company relinquished all claims on Contract 11, and on October 7, 1913, Claiborne, Johnston & Company assumed entire charge of the work. Work on Contract 11 has progressed in a satisfactory manner, the contractors having earned, up to date, $834,474.24, or 21 per cent. of the entire contract price. This includes the most tedious work to be constructed under their contract.

About 80,000 cubic yards of earth have been excavated, mostly by means of a Marion Steam Shovel No. 3, although a portion of the earth was removed by wheel scrapers. Most of the excavated material has been placed directly in the embankment or in the dams, both of which are nearly completed. The steam shovel loaded into 3-yard dump cars, which were hauled by 18-ton locomotives over a narrow gauge track laid with 60-pound rails. Dam No. 2, which is planned for a spoil bank and possible emergency use, was built by dumping the material from a trestle, but it was not rolled or tamped.

The site of Dam No. 1 was carefully prepared by stripping of all unsuitable material. The excavation for the conduit and the toe wall was carried to solid rock. The earth used for the construction of the dam was composed largely of clay and when deposited in thin layers and rolled with a 12-ton steam roller made a very compact embankment, almost equal to clay puddle. Seams that were encountered in the rock foundation under the toe wall were filled with grout forced in under pressure. With the exception of the foundation for Dam No. 1, the only rock encountered was in making the excavation for the main drain.

The concrete work for the main drain is nearly completed. There was a daily average of 51 men employed on the work up to October, and during the months of October, November and December the daily average was 119 men.

The contractors are planning to erect a cableway to enable them to operate to better advantage when work is actively resumed in the spring.

Contract No. 12—Sluice Gates.

Four bids were opened on June 18 for furnishing sluice gates for the entire filtration plant. The Coffin Valve Company of Boston, Mass., was awarded the contract for $16,356. Most of the gates to be furnished under this contract have been made and over half of them have been delivered on the ground. Estimates have been paid amounting to $9,023, or 55.1 per cent. of the contract price.

Contract No. 13—Valves.

The contract for all valves to be used in the construction of the plant was awarded to the Columbian Iron Works of Chattanooga, Tenn., for $21,234.56. Eight bids were opened on June 18. Some of the valves under this contract have been manufactured and are being held at the works at Chattanooga, owing to the fact that we are not ready for them to be delivered on the work. Several of the large valve companies who were much interested in the first proposal for Contract 11 failed to bid on this contract.

Contract No. 14—Cast Iron Pipe and Specials.

Four bids were opened on June 18 for cast-iron pipe and specials. The Glamorgan Pipe and Foundry Company was awarded the contract for $44,594. Pipe and specials have been delivered on the ground in compliance with the terms of our contract to the value of $12,492, amounting to 28 per cent. of the contract price.

Contract No. 18—Drayage.

Two bids were received on July 16 for hauling sluice gates, valves and pipe from the Harford avenue siding of the Baltimore and Ohio Railroad to the filtration plant. Peddicord Sons' Transfer Company being the lowest bidders, the contract was awarded to them for $1.40 per ton. They have hauled all shipments to date.

Contract No. 19—Pumping Machinery.

On September 10 eight bids were received for furnishing and placing of the pumping machinery for operation of the filtration plant. The Southwark Foundry and Machine Company of Philadelphia being the lowest bidder, the contract was awarded to them for $22,809. A large part of this work was made necessary owing to the fact that the high dam at Loch Raven is not to be built at the present time.

Contract No. 20--Electric Power Equipment.

Bids were opened on September 10 for furnishing the motors, transformers, wiring and electrical equipment necessary for the operation of the pumps and various devices for use in the filtration plant. The Westinghouse Electric and Manufacturing Company of Pittsburgh, Pa., being the lowest of five bidders, the contract was awarded to them for $26,800.

Contract No. 21—Head House, Pumping Station and Conduit.

This contract was for the remaining concrete structures to be built in connection with the filtration plant. There were three bids for this work; that of the Elkan-Tufts Construction Company of Baltimore for $94,610.63 being the lowest, the contract was awarded to them. They have earned to date $22,603.20, or 23.9 per cent. of the contract price. The excavated material became harder as the depth below the surface increased, forming a most excellent foundation for the buildings. At the pumping station site rock was encountered at about the elevation where the shaft dropped below the floor level. As this work is more concentrated than that of the other contracts, and as a large portion of it extends above ground, the contractors will, in the event of a mild winter, be able to work most of the time. During the months of November and December an average of 46 men were employed each day on the work.

Contract No. 4—Filtered Water Reservoir.

This contract was awarded to C. W. Lane & Company of Atlanta, Ga., on November 20, 1912, and work was started within a few days after the award of the contract, but has progressed in such a dilatory manner that on the last day of the year, when the contract time expired, but 62.4 per cent. of the contract price had been earned; or, making an allowance for the omission of clay puddle, 66.3 per cent. The entire excavation on this contract, involving the removal of 55,000 yards of earth, was carried on by means of wheel scrapers. At no time were there more than ten scrapers employed at once, and a major portion of the time there were but seven or eight scrapers engaged on the work. The small number of scrapers was the cause of some delay in placing the concrete bottom. Under this contract no allowance was made for rock excavation and a considerable amount of disintegrated rock, which was too hard to plow, and solid rock was encountered in Reservoir No. 2 and had to be blasted.

On October 20 an accident happened to a portion of the roof already built by the collapse of 17 groined arches, which proved, on investigation, to be due to the premature placing of the earth embankment against the reservoir wall and on the top of the arches.

During the months of January, February and March a daily average of 20 men were employed on the work. During April, May and June the average was 56, and during July, August and September the daily average was 129.

The fact that the contractors have not completed their work on contract time is quite a serious handicap to us, as their plant occupies a portion of the ground needed for the construction of our Contract 11. Unless their work is pushed with unusual vigor in the spring, it will cause a serious delay in the completion of the plant.

Shop Inspection of Materials.

The city's interests have been safeguarded by having the reinforcing bars, sluice gates, valves and cast-iron pipe and specials inspected at the point of manufacture. The method of inspecting material before delivery on the ground has proven satisfactory, as it saves annoyance and trouble on the job.

Pumping Station.

The decision of the Water Board to postpone the construction of the high dam to some future date made necessary the construction and equipment of a pumping station, which was not contemplated in the original plans for the filtration plant. This work involved the construction of a much more expensive building and a much more elaborate equipment in every way than would have been the case had the station been built only for emergency.

Electric Power Equipment.

After investigating the best method of operating the filtration plant, taking into account both construction and operating costs, it was decided to equip the station electrically and buy the power from the Consolidated Gas Electric Light and Power Company, a tentative agreement having been drawn up with that company whereby power can be purchased for less than one cent per kilowatt hour.

Aerators.

Failure to build the high dam made it necessary to abandon the plan of aerating the water before filtration, on account of the prohibitive cost of pumping water the additional height necessary for operating the aerators. Provision, however, has been made for building the gate houses and equipping them with the necessary means of controlling the water should it be deemed advisable to add aerators at a future date.

Removal of Office.

On September 5, 1913, the entire office of the Filtration Division was moved from the Knickerbocker Building to Lake Montebello, where it is a present housed in the dwelling formerly occupied by the late William A. Kenly.

Employees' Residence.

On the property recently acquired for the purpose of constructing the filtration plant there were two houses. One of them, owned by Josephine Rappe, was, according to agreement, torn down and removed by the owner from the ground, with the exception of the foundation. The other, owned by Robert Brodie, was removed east of the coagulating basin, where it was set upon a new foundation with the expectation of using it as an employees' residence. The work of moving the house was done by Stewart-Jones and Claiborne, Johnston & Company, under their contract as extra work.

Future Contracts.

Two large contracts and several small ones are still to be awarded. One for the furnishing and placing of the filter equipment has been practically ready for advertising for some time, but owing to certain contemplated changes it will probably not be ready for a letting until February. Plans and specifications are well under way for a contract for the superstructures of buildings which, outside of Contract 11, will probably be the largest single contract to be awarded in connection with the filtration work. It will probably be ready for letting early in the spring.

Drawings.

During the past year the Filtration Division have made the following drawings:

Traced and recorded	138
Traced in an uncomplete condition	29
Drawn, but not traced	8
Recorded drawings, principally cross-sections, etc	95
Total	270

Engineering Force.

Owing to the number of contracts into which the work has been divided and to the fact that construction and designing work is being carried on simultaneously, it has necessitated a material increase in the engineering force. There are now 23 men on the pay roll, including engineers, draughtsmen, inspectors, etc.

Property.

During the year the following property has been acquired:

	Acres.
Thomas Brodie	3.16
Robert Brodie	8.09
Josephine Rappe	2.45

Negotiations are in progress for acquiring the small graveyard adjacent to the mixing basin, containing 0.271 acres, and also for the following properties:

	Acres.
Estate of Mrs. Mary Green	2.90
John Graham	3.00
Thomas Brodie	1.78

Park Board.

The Park Board have given their consent for the use of a tract of ground owned by them and located between the Water Board's property and the estate of Mrs. Mary Green. Upon this tract Dam No. 2 and certain roads are to be built. It is the purpose to build additional driveways and to beautify the grounds adjacent to the filtration plant in such a way as to make the place attractive as a park.

Consulting Engineers.

On several different occasions Mr. George W. Fuller of New York was consulted in reference to plans and specifications, and was engaged to advise us in connection with the patent situation. Mr. John W. Gregory was employed to report on the groined arch accident of October 20.

Experiments.

In order to determine whether or not it would be safe to omit the wire screen usually employed between the sand and gravel layers in filters using a high rate of wash, an experimental filter was built and placed in the Gay Street Yard. A series of tests seemed to prove that it was entirely safe to omit this wire screen when washing filters at rates between 2 and 5 vertical feet rise per minute. A section of the proposed strainer plate was also tested to destruction as nearly as possible under operating conditions to determine the load that it would carry.

Plan of Operation.

Those who are not familiar with the plans, and care to understand the process of handling the water, will be helped somewhat by referring to the general plan and the following description:

The existing 12-foot tunnel, which conveys the water from Loch Raven, will be the only source of supply. The tunnel passes under the center of the filtration plant and has its invert at elevation 143, which is 69 feet below the driveway that surrounds the station. The pumping station is circular in form and rising in its center is the intake shaft, 16 feet internal diameter, from which the centrifugal pumps take their suction. The pumps are supported upon a floor at elevation 193 and are arranged radially around the shaft. They discharge into the 6-foot concrete conduit that surrounds the station, both ends feeding an 8-foot conduit and Venturi meter, through which the water flows into the stilling chamber of the head house.

In the course of ordinary operation, water is admitted from the stilling chamber to the mixing basin and, as it enters, lime is added to it. The mixing basin is divided into narrow passages by baffles, which keep the water moving at a velocity sufficient to hold most of the lime in suspension and thoroughly incorporate it with the water. After the lime-treated water has passed around a few of the baffles, sulphate of iron is added. The lime and iron prepare the water for filtration by forming small flocs of coagulated matter, which contain most of the particles held in suspension, together with the chemicals added to the water.

In the coagulating basins, the water moves very slowly and most of the flocs are precipitated to the bottom, carrying with them most of the bacteria. The smaller flocs that do not settle out quickly are removed by the filters.

The chemicals are stored, mixed and controlled in the head house, and are applied to the water automatically in direct ratio to the amount flowing into the basins, as measured by the Venturi meter. After passing through the mixing basin, the water enters the intermediate conduit of the center passage and flows through it to the Coagulating Basin No. 1, where it is admitted through five 48-inch by 48-inch sluice gates, which are separated in such a way as to distribute the flow as uniformly as possible over the north half of the basin. After the water has passed around the baffle, it is skimmed over a wier and conveyed to the upper conduit of the center passage through five 54-inch by 54-inch sluice gates, whence it passes to the gallery conduits and then to the filters.

The coagulating basins are about 232 feet by 318 feet inside dimensions and it requires 1½ hours' time for water to pass through each, or 3 hours through both, when they are operated in series at the normal rate of 128,000,000 gallons per day. The coagulating basins can also be operated in parallel or used singly, as will be the case when one of the basins requires cleaning. There are 32 filter units built along two parallel galleries, eight being constructed on each side of each gallery. Each filter unit has a normal capacity of 4,000,000 gallons, a net sand area of 1,440 square feet and measure 55 feet 6 inches by 32 feet outside dimensions.

After filtration, the water passes through the piping under the filters into the intermediate conduits in the pipe galleries, through which it flows backward as far as the center passage, and as it turns to enter the basins under the filters hypochlorite of lime is added as a sterilizing agent. By admitting the water to the basins at the back, it is kept constantly in motion toward the outlet and all dead water pockets are avoided. There are three basins under the filters, having an aggregate capacity of about 2,500,000 gallons. It is possible to empty any or all of them for cleaning or repairs and still use all the filters. From the basins the water enters the filtered water reservoirs through a short section of 8-foot circular conduit. The twin reservoirs, each holding a little over 7½ million gallons, will ordinarily be used in parallel.

Water will flow directly into the city distribution system from the reservoirs, which are high enough to feed by gravity the intermediate and low level districts. As the consumption of water at different hours of the day varies considerably, and as the storage reservoir is small, it is planned to control the flow of water through the plant automatically and have it respond to the demands of the city for water. The filter controllers will be operated in such a way as to permit the water to enter the system at a maximum rate when the level in the filtered water reservoirs falls below a certain predetermined point, and as the water rises it will gradually slow down the filters until they will be completely shut down when the water reaches a fixed maximum level.

After a period of service the filters gradually become clogged. For the purpose of cleansing them, pure water is forced upward through the sand at a very high rate, about 2 cubic feet per minute per foot of sand area, which is the equivalent of 32 million gallons per day per filter, or about eight times the rate of ordinary filtration. Water at this rate will be applied only for a period of from 5 to 8 minutes. If the wash water was applied directly it would take a large pump, which would operate for a few minutes and then remain idle for a much longer period of time. As this is not desirable, small pumps run continuously, or nearly so, are used for filling two large concrete tanks from which the wash water is drawn.

After washing, the dirty water passes through concrete conduits to the settling reservoir, formed by constructing a dam across a ravine adjacent to the plant.

LIST OF EMPLOYEES OF FILTRATION DIVISION.

Name.	Title.	Date of Employment.
James W. Armstrong	Engineer Filtration Division	July 17, 1912.
Steuart Purcell	Asst. Division Engineer	July 16, 1912.
Arthur L. Reeder	Chief Draftsman	July 16, 1912.
I. Ellis Behrman	Resident Engineer	January 2, 1914.
H. A. Loser	Designing Engineer	October 23, 1912.
V. Bernard Siems	Asst. Engineer, Grade "A"	September 1, 1912.
Leon Small	Draftsman, Grade "A"	September 1, 1912.
Frank Fahm, Jr.	Asst. Engineer, Grade "B"	October 23, 1912.
E. H. Eardley	Draftsman, Grade "B"	July 29, 1912.
Ralph K. Linville	Asst. Engineer, Grade "B"	July 1, 1913.
Henry J. Horn	Inspector, Grade "B"	October 21, 1912.
I. Barton Kreis	Clerk and Stenographer	July 21, 1913.
Thomas B. McAllister	Inspector, Grade "D"	June 10, 1913.
Edwin J. Lake	Inspector, Grade "B"	September 4, 1913.
William F. Preston	Rodman	August 27, 1913.
Arthur F. Brownley	Rodman	September 9, 1913.
F. L. Brown	Rodman	September 11, 1913.
George W. Nighman	Inspector, Grade "D"	September 25, 1913.
Carroll D. Weatherly	Instrument Man	October 6, 1913.
Murray Roberts	Rodman	October 6, 1913.
Carlton D. Cann	Inspector, Grade "C"	November 18, 1913.
E. F. Lang	Messenger	September 3, 1913.
William C. Thomas	Watchman	September 27, 1913.
A. E. B. Jones	Inspector, Grade "A"	January 3, 1913.

APPENDIX No. 1—FILTRATION DIVISION

Report on the Most Practicable Method for Filtering Baltimore's Water Supply.

By George W. Fuller, Consulting Engineer

BALTIMORE, June 19, 1912.

MR. EZRA B. WHITMAN, *President and Water Engineer,*
Water Board, Baltimore, Md.

DEAR SIR—Pursuant to your instructions of April 16, 1912, I have examined into, and herewith report on, the most practicable method for filtering the new impounded water supply of Baltimore to be obtained from the projected storage reservoir upon Gunpowder River at Loch Raven.

Statement of Problem.

On March 25, 1910, Messrs. John R. Freeman and Frederic P. Stearns made a comprehensive report on the enlargement and improvement of the Baltimore water supply. Among other things, they recommended the installation, near Lake Montebello, of a covered sand filter plant of a net area of 20 acres and of a normal rated capacity of 120 million gallons daily. The water from the new storage reservoir at Loch Raven would flow through a new tunnel connection to a coagulating and settling reservoir in the valley of Mine Bank run; and thence the partially clarified water would flow through the existing tunnel to the filter site near Lake Montebello. These recommendations were predicated upon a report by Mr. Allen Hazen under date of October 28, 1909, and also a report by Mr. George C. Whipple under date of March 11, 1910.

Mr. Whipple made an extended study of turbidity conditions relative to the water to be drawn from the proposed 20-billion-gallon reservoir at Loch Raven, which would have tributary to it a drainage area of about 305 square miles. This drainage area or water-shed is characterized by the presence of clay-bearing material over a substantial portion of it. It has many steep slopes, but practically no swampy tracts. Much of the area is under cultivation. Each rain brings much soil wash into the streams. Some of the turbidity is caused by silt and particles which subside quite readily, but much of it is due to microscopic or sub-microscopic particles of clay, which are frequently spoken of as colloids. They do not subside readily, and it is practically out of the question to remove them completely from the water at all times without some use of coagulating chemicals.

When the Gunpowder River was first developed as a source of water supply for Baltimore, some forty years ago, it was the plan, following heavy rains and when the river water was muddy, to shut off the head gates at the entrance to the tunnel. During these interruptions in delivery to the city, the needs of the water consumers were adequately taken care of from storage reservoirs in the city. As the consumption has increased, the inadequacy of this method has become more and more apparent. In fact, during the past year the rainfalls have been of such frequency, with respect to the appearance of high turbidities in the Gunpowder River, that it has been necessary at times to deliver to the citizens water which has been noticeably and objectionably turbid.

When the new storage reservoir is completed, it will impound the flood flows in order to insure a sufficient quantity of water in the future at times of dry weather.

Obviously, it will no longer be possible to supply the city with fairly clear water found during intervals between heavy rains. Muddy water will have to be stored in the new reservoir, and such water will mix with clear water to a considerable extent, depending upon conditions as to the quantity and quality of the inflowing water at times of rains, with respect to that already stored in the reservoir.

Mr. Whipple estimates that the turbidity of the water entering the new reservoir at Loch Raven will approximate 200 parts per million. Of great importance in the consideration of this proposition is an estimate of the turbidity to be expected throughout a term of years in the water as drawn from this proposed storage reservoir. The problem is a complex one, as it involves the influence of sedimentation upon the silt and clay particles in the water as it enters the reservoir; and also the effect of mixing in an irregular way of the partially clarified water with fresh quantities of soil wash which will enter the reservoir with every heavy rain. The latter action is at cross purposes with the clarifying benefits of sedimentation.

From extended observations from June to December, inclusive, 1909, Mr. Whipple concluded:

> Just what the minimum turbidity would be cannot be accurately predicted. It probably would not be less than five, and it might be as high as 10 or 15. Occasionally the water of the reservoir might be displaced in a comparatively short time and the sedimentation period reduced to a week, or even less. At such times the turbidity of the inflowing water would be high, and the entire body of water in the reservoir would be very turbid. If it be assumed that at such times the average turbidity of the inflowing water is 1,000, the turbidity of the water at the dam might be as high as 200, and possibly higher for short periods.
>
> On account of the many factors involved, it is difficult to make a reliable estimate of the average turbidity of the water that will be found at the lower end of the proposed reservoir. The following estimates seem to be reasonable deductions from the data obtained: Minimum turbidity, 5; most common turbidity, 10 to 20; ordinary maximum, 100 to 200; maximum rarely reached, 500. It is not likely that the turbidity of the water would be above 100 for more than about one month in the year.

Mr. Hazen records the impracticability of obtaining a thoroughly satisfactory supply from the new reservoir without adequate means of removing this turbidity. To prevent soil wash, and thus maintain the water from the storage reservoir free of muddiness and turbidity, is out of the question, if for no other reason than on the score of cost. It is necessary, therefore, to consider means of freeing the stored water uniformly and completely of turbidity.

It is not feasible, as Mr. Hazen states, to remove uniformly the large quantities of colloidal or sub-microscopic clay particles without a coagulant which will provide a gelatinous material to unite the tiny particles together into aggregates of such size that they may be removed by sedimentation or filtration, or both.

Mr. Hazen considers carefully the different available means of clarification of the water of the new Loch Raven reservoir. The first of these consists of coagulation and sedimentation without filtration. The other two projects comprise, in addition to coagulation and sedimentation, a sand filter plant near Lake Montebello, and a mechanical filter plant in the valley of Mine Bank Run, respectively.

In all three projects a coagulation and sedimentation plant would be installed in the valley of Mine Bank Run. The solid matters removed from the water could here be disposed of more advantageously than at any other site. With mechanical filters it is necessary to settle the water after coagulation only for four to six hours, or perhaps less. For the other two methods the period of sedimentation should be several days, in order to secure satisfactory results.

In each case it will be necessary to build a new tunnel, with proper shafts, connections, aerating facilities and regulating arrangements, to divert the water by gravity from the new impounding reservoir to the coagulating and sedimentation works in the valley of Mine Bank Run. After treatment at these works the water would flow by gravity through the existing tunnel to the vicinity of Lake Montebello, where, with each of the filter projects a covered filtered-water basin would be built. The filters themselves, however, would be located, in the case of a mechanical plant, in the valley of Mine Bank Run, and in the case of sand filters, near Lake Montebello.

The cost of construction and operation of those structures and devices that relate strictly to filtration of the water was estimated by Mr. Hazen, and these estimates were adopted by Messrs. Freeman and Stearns in the case of sand filters, as given on page 60 of their printed report. Mr. Hazen's estimates of cost for sand and mechanical filters are given on pages 198, 202, 206-208 of the printed report. These estimates may be summarized for reference as follows:

ESTIMATED COSTS OF CONSTRUCTION OF SAND AND MECHANICAL FILTER PLANTS WITH APPURTENANCES OF A RATED CAPACITY OF 120 MILLION GALLONS DAILY—1910 REPORT.

	Sand Filters.	Mechanical Filters.
Coagulating and settling basin and appurtenances, including land damages......	$370,000	$370,000
Filters and appurtenances, including land damages	1,540,000	1,200,000
New covered filtered-water reservoir........	150,000	150,000
	$2,060,000	$1,720,000
Add 15 per cent. for engineering and contingencies	309,000	258,000
	$2,369,000	$1,978,000

Mr. Hazen estimated the cost of operating sand and mechanical filters, when delivering 90 million gallons daily, as follows:

ESTIMATED COSTS OF OPERATION OF SAND AND MECHANICAL FILTER PLANTS WHEN DELIVERING 90 MILLION GALLONS DAILY—1910 REPORT.

	Sand Filters.		Mechanical Filters.	
	Per Million Gals.	Per Annum.	Per Million Gals.	Per Annum.
Labor, supplies, care of roads, grounds, light, fuel and wash water	$1.25	$41,200	$1.00	$33,000
Office-laboratory, conducting experiments and general expenses	0.70	23,000	0.70	23,000
Coagulant	0.20	6,600	1.57	52,500
Special labor for coagulation not included above	0.25	8,200	....	....
Totals	$2.40	$79,000	$3.27	$108,500

If we add five per cent. per annum to the estimated investment above given, to cover interest charges and extraordinary depreciation, the total yearly cost for the two types of filters is as follows:

Per Annum.	Sand Filters.	Mechanical Filters.
Operation and maintenance	$79,000	$108,500
Interest and depreciation	118,450	98,900
Totals	$197,450	$207,400

I agree with Mr. Hazen that coagulation and sedimentation, to be used as a complete process by itself, would not prove wholly satisfactory as regards the quality of water which would be produced at all times. The use regularly of hypochlorite of lime as stated would correct deficiencies from a sanitary standpoint. But the likelihood of shortcomings of sedimentation alone is quite serious as to the physical character of the water as delivered to the consumers, relative to appearance, taste or odors. I agree with Mr. Hazen that this arrangement should not be considered a permanent solution of the problem of supplying the City of Baltimore with pure and clear water. I view it solely as a temporary expedient, such as you have very properly adopted within the past few days to alleviate the annoyance of the water consumers due to the turbidity in the water as delivered during the past few months.

As between sand filters and mechanical filters, Mr. Hazen states that, when constructed according to the arrangements which he describes and when operated in the best manner, a thoroughly satisfactory quality of water in either case will be given at all times. I agree with him fully in this regard. He states, however, that he should give some preference to sand filters, and this opinion is concurred in by Messrs. Freeman and Stearns. It is predicated apparently on the following points, which are stated not to be of controlling importance; but as there is not much difference in the total cost as estimated by Mr. Hazen, it is evident that some weight has been given to them.

1. Sand filters are regarded as of greater reliability in removing the effects of whatever pollution there may be in the water.

2. While it is imperative to use coagulant in order to get clear water, it is stated that mechanical filters as distinguished from sand filters require the continuous application of coagulant and the period of coagulation is usually shorter. Very much less inconvenience is said to be anticipated with sand filters than with mechanical filters as regards red water, due to the corrosion of pipes by certain constituents of the water.

3. With the larger amount of coagulant such as required with mechanical filters, there is no increase in the total hardness with the application of sulphate of alumina, as proposed, but there is a slight change in the carbonate or temporary hardness to the sulphate or permanent hardness, and this makes the water slightly less desirable for boiler purposes.

Before expressing my views on these questions, it will be well to record briefly the additional data now at hand to throw light on the situation.

New Data.

You have called my attention to a number of new data locally obtained at Baltimore relative to this proposition, as follows:

A (Turbidity Data)—Additional records are now available showing the turbidity in the Gunpowder River water, as drawn from the present reservoir at Loch Raven for a full period of three years. As shown by monthly averages in the following table, the heavier rainfall of the past year has increased the turbidities materially above those ordinarily found during the period in which Messrs. Hazen and Whipple had these matters under observation.

MONTHLY AVERAGE TURBIDITIES, IN PARTS PER MILLION, IN THE WATER OF GUNPOWDER RIVER AT THE PRESENT LOCH RAVEN DAM.

May	15	May	9	May	32
Annual Mean	81		34		119

The amount of rainfall is apparently of less importance than the frequency and intensity of precipitation. Under present conditions a sharp local shower may produce more turbidity than a long steady rain. In the future, with increased storage, the turbidity of the reservoir water will probably not reach as high figures as at present, but the duration of periods of well defined turbidity will be longer.

It is my conclusion that during ordinary years the water applied to sand filters can advantageously be treated with a coagulant for four to six months, averaging perhaps five months per year.

B (Fineness of Clay)—Further tests conducted at the experiment station at Loch Raven show that sand filters have been unsuccessful to an unusual degree in removing turbidity from the local water, either that from Loch Raven reservoir or that coming from the area tributary to a small basin above the station. In other words, the size of these submicroscopic clay particles is unusually small. This is confirmed by the coefficient of fineness of the particles causing the residual turbidity in this settled water, as determined by laboratory methods.

C (Open Sand Filters)—Under the direction of Mr. A. M. Quick, former Water Engineer, the Gunpowder Division of the engineering corps of your Department prepared plans and estimates of cost for a sand filter plant to be located near Lake Montebello. As compared with Mr. Hazen's project, the chief characteristics of this design are: First, that the 20 acres of filters are uncovered; and, secondly, that the sand layers will be cleaned in place by a washing machine of the Blaisdell type, such as is now in use at Wilmington, and being installed at Montreal. The estimates of cost of construction, when coupled with the figures above given by Messrs. Freeman and Stearns for settling and coagulating basins, are as follows:

ESTIMATED COST BY WATER DEPARTMENT OF OPEN SAND FILTER PLANT—CLEANED BY BLAISDELL WASHING MACHINES—INCLUDING 15 PER CENT. FOR ENGINEERING AND CONTINGENCIES.

Coagulating and settling basin and appurtenances, including land damages (Freeman and Stearns)	$425,500
Filters and appurtenances, including land damages	1,156,700
New covered filtered-water reservoir	288,800
Total	$1,871,000

The estimates of cost of operating this open sand filter plant, to be cleaned with a Blaisdell washer, and to yield 90 million gallons daily, according to the records of the Department which you have given me, are as follows:

	Per Million Gals.
Labor, supplies, care of grounds, lights, fuel and wash water	$0.91
Office and laboratory	0.35
Coagulant and labor connected therewith	0.45
Total	$1.71

It is seen that the office and laboratory cost is taken at one-half of Mr. Hazen's estimate, based on Washington experiences. The total allowance for heat, light and power, excluding labor, is taken at $0.295 per million gallons, which is less than half of a recent estimate for this item for a covered filter of this type at Jerome Park Reservoir, New York city.

Independently of developments at Baltimore, recognition has been taken of advances in the art of water purification as demonstrated on a large scale during the past two and one-half years or so, since Mr. Hazen's report was prepared. Reference is made briefly as a matter of record to the following points, which are worth mentioning, owing to the numerous features noted on the recent inspection trip which you and I took.

D (Sterilization)—Hypochlorite of lime for purposes of sterilization is now used at a large number of filtration plants, probably at more than 100, for purposes of insuring a higher grade of filtered water, hygienically, at all times. This oxidizing chemical is ordinarily applied to the filtered water, which varies but slightly in its composition as to organic matter. Hence, it is a simple matter to apply this efficient method at nominal cost in conjunction with filtration. With a plant which for purposes of clarification must receive the technical supervision that is needed for the treatment of the Gunpowder River water, no apprehension need be felt as to the application of this method uniformly and reliably. In my judgment, it eliminates whatever theoretical and sentimental preferences may have earlier existed as to the superiority of sand filters over mechanical filters for the treatment of clay-bearing waters.

E (Mechanical Filter Record)—The past few years have seen a wonderful record of uniformly successful daily accomplishments by mechanical filters, not only in securing uniformly a water free of turbidity, but also a water of excellent hygienic character independent of sterilization. Reference is made in particular to the well-known mechanical filters at Harrisburg, Cincinnati, Columbus, Louisville, New Orleans, Toledo and other places where turbid waters have been treated. In brief, the art of mechanical filtration, as shown by large and important plants in practice, has now come to the level of what was shown to be feasible in test devices a dozen years ago or more. Formerly the performances of some old-fashioned, poorly-arranged and ill-managed mechanical filters went a long way to offset the standing and technical merit of the process of mechanical filtration. No longer is this true.

F (English Filter Record)—While the accomplishments of mechanical filters have shown a steadily increasing mass of data accrediting their efficiency and manageability, the record of sand filters dealing with turbid waters has been one indicating an increased dependence upon more and more complete preparatory treatment. In 1898 I showed, in the tests conducted in Cincinnati, that sand filters, particularly during the winter months, experienced difficulty in showing normal results when the turbidity of settled waters exceeded about 30 parts per million. For short periods turbidities much in excess of this figure can be satisfactorily handled, as is actually the case on a large scale at Pittsburgh. During the summer months sand filters work more easily and can regularly dispose of turbidities at fully twice the figures above stated. Notwithstanding this, the history of sand filters during the past ten years has been one of difficulty in securing adequate clarification and normal volumes of water filtered at all times between cleanings. Preliminary filters have been built at Albany, Philadelphia, Wilmington and Steelton, and are now under construction at Pittsburgh and Montreal. The purpose of these devices is to keep the limits of turbidity or of the amount of vegetable growths in the applied water within workable limits. In some cases, as at Poughkeepsie, N. Y., Washington, D. C., and Indianapolis, Ind., sand filter plants are aided through a preliminary treatment, such as suggested for Baltimore by Mr. Hazen, namely, coagulation and sedimentation. In these instances it is the plan to apply a coagulant when the turbidity in the unfiltered water reaches 30 to 40 parts per million or more. In fact, as showed by our inspection trip, coagulants are used with sand filters with more frequency than was at first anticipated.

While mechanical filters, as you have noted from our recent inspection trip to a majority of the larger and better known plants of that type, uniformly produce clear, brilliant water, this is quite in contrast to the appearance of the effluent produced by some sand filter plants at times when the applied water shows turbidity in cases of the limits above indicated.

G (Red Water Question)—With the development of mechanical filters and the general improvement in the quality of water supplies, attention has recently been directed to what has frequently been called the "red water" trouble. This means the appearance in the water of iron rust, caused, to a considerable extent, by the corroding action of the water on pipes, particularly small pipes in the houses of consumers. This feature has been noted in the case of soft waters, and but rarely where the water has been hard. In other words, it has been confined largely to the Atlantic Seaboard. As between sand-filtered water and mechanically-filtered water, the records indicate that mechanical filters frequently show more corrosion, although this does not seem to be always the case. This seems to be associated in part with the liberation of carbonic acid in the water, due to the coagulating treatment. When carbonic acid is naturally high in the unfiltered water, it seems to cause at several plants noticeable quantities of iron rust and soluble iron in the water as drawn in the household. Even with soft waters it is feasible to keep this factor within reasonable limits by the addition of soda or of lime. By the use of lime and iron, however, as applied at Cincinnati and New Orleans as a coagulant instead of sulphate of alumina, the carbonic acid is eliminated from the filtered water. As a result of such coagulation it can scarcely be intimated that the "red water" factor is worthy of consideration. This method of coagulation is not applicable to waters which contain much vegetable stain, as at Toledo, Ohio; Watertown, N. Y.; Springfield, Mass.; New York city; Little Falls and New Milford, N. J. For the water of the Gunpowder River there is no coloring matter to make such a complication, and it is entirely feasible to utilize lime and iron rather than alum as a normal method of coagulation. With this process, then, the element of red water spoken of in several places in the report of Messrs. Freeman and Stearns may be dropped out of consideration.

Without further detailing the various recent developments in water filtration elsewhere, as noted by our inspection trips and from the study of results recorded by those in charge of the more important plants, I shall state my findings upon the main points at issue at Baltimore, as follows:

Covered Sand Filter Plant.

In my judgment, the plan for treating the new Baltimore supply in a covered sand filter plant in accordance with the general experience at Washington, will give a satisfactory result at all times, upon the assumption that the plant would be well built and well managed, as Mr. Hazen states. I believe that the estimates of cost of construction as given in the printed report for 1910 are fair and reasonable. In looking into the matter of details it has seemed to me that the estimates of cost of construction for the coagulating and settling basin are perhaps somewhat low, particularly when compared with corresponding figures on the mechanical filter project. However, you have informed me that Mr. Hazen's assumptions as to land values are rather high, so I have concluded that these two items may be reasonably assumed to offset each other.

Regarding the estimated cost of operation of a covered sand filter plant, I agree fully with Mr. Hazen's estimates except in so far as relating to the chemicals used for treating the water. As already stated, additional data have been obtained at Baltimore since Mr. Hazen's report was prepared, indicating that the turbidity would be materially greater on an average than he assumed. In fact, as already stated, I believe that, based on experiences with other sand filter plants, a coagulant would be used at Baltimore for five months during an average year, and that its cost may be assumed to be 60 per cent. of that which would be required with a mechanical filter plant.

I also believe that it would be prudent, from a hygienic standpoint, to assume that about five pounds of hypochlorite of lime would be added to the filtered water at all times for purposes of sterilization.

As regards the "red water" aspects of the proposition, I consider that the use of lime and iron is feasible for the treatment of the local water, and that this treatment will cause the factor of corrosion to come under satisfactory control; and, in fact, to be less than would be the case with plain sand filtration without any coagulating chemical.

In the event that sulphate of alumina should be preferred for any reason as a coagulating chemical, it is possible to use lime or from time to time to eliminate any excessive quantities of free carbonic acid. This is a part of the mechanical filter project recently recommended for the Croton water supply of New York city.

Open Sand Filter to Be Cleaned by Washing Machines After the Designs of the Water Department.

I have had occasion to study carefully the behavior of the Blaisdell washing machine as now used at Wilmington, Del. In fact, I recommended its adoption at Montreal, P. Q., for the cleaning of high-rate sand filters which will receive the clear effluent of high-grade preliminary filters. I have also studied the suitability of this machine for the Croton filter project for New York city.

To apply this method of sand cleaning to uncovered filters in the climate at Baltimore is, in my judgment, a risky proposition. In fact, I am very skeptical as to its reliability of performance during the winter months when ice upon the filters becomes a serious factor. It is proposed as a part of this design to provide means for eliminating the ice either by cutting or melting appliances. Their success has not yet been demonstrated on a practical scale, and I am unwilling to advise them in view of present evidence.

To apply this method of sand cleaning, it is necessary, in my judgment, to use covered filters. This would not only bring the expense of construction up to, but somewhat in excess of, the Washington style of design, as estimated by Mr. Hazen. This excess cost is due partly to the necessity of having a higher vaulting for the filters in order to give head room for the washing machines, and partly to the cost of the machines themselves with the necessary wiring and heating arrangements.

Recent economies in sand cleaning, such as developed at Washington and several other places, have now reached a point where I am convinced that the advantages of the Blaisdell washing machine are ordinarily insufficient to offset the increased investment which it requires in order to put the process on an undisputedly safe and reliable basis.

As to estimates of cost of operation, I have compared carefully the figures prepared by your predecessors with those given by Mr. Hazen and others with which I am personally familiar elsewhere.

There is nothing in the Blaisdell arrangement which justifies any reduction either in the investment or in the operation and maintenance of a coagulating department; or in the laboratory or supervision of the sand filter proper. Moreover, the Blaisdell machine requires a substantial item for the electric current to operate the machine and to provide suitable heating during the winter.

I am aware that at the new Loch Raven dam the opportunities look promising for an advantageous installation of an electric generating station actuated by waterwheels driven by the surplus water. Notwithstanding the favorable outlook for the development of cheap electric power by the Water Department, I am clearly of the opinion that there is no superiority or economy in performance to be expected under the local conditions with a sand filter plant designed with mechanical appliances for washing the sand in place. Therefore, I dismiss this design and confine my comparisons to the relative merits of a sand filter plant of the Washington type and of a mechanical filter plant following the lines of successful practice at Cincinnati and New Orleans.

Mechanical Filter Plant.

I accept Mr. Hazen's report as regards the location, size and arrangement of a mechanical filter plant and its various appurtenances, together with estimates of cost of the same, with the following exceptions:

I believe that the cost of construction of the mechanical filters should be reduced from $10,000 per million gallons daily capacity to $7,500. The actual corresponding cost for the Cincinnati plant was less than $6,000. Making reasonable allowances for increases in price of labor and whatever discrepancies there may be as to an administration building and outside pipe lines, I consider that $7,500 is a fair and reasonable figure. This would mean, with 15 per cent. for engineering and contingencies, a saving of $345,000 over Mr. Hazen's estimate.

I consider that Mr. Hazen's estimate for cost of operation and maintenance is fair and reasonable, except that I would add a small item covering the cost of sterilizing the filtered water, as stated above in connection with sand filters.

Comparative Summary.

Having dismissed the open sand beds with Blaisdell washing machines as impracticable, in my judgment, for local conditions, for the reasons stated in preceding pages, it remains to compare the relative merits of sand filters and mechanical filters in the light of additional information obtained since Mr. Hazen's report of October, 1909. In point of efficiency, I rate them as equal. Their comparative costs I estimate to be as follows:

REVISED ESTIMATE OF COST OF CONSTRUCTING SAND AND MECHANICAL FILTERS, WITH APPURTENANCES, OF A RATED CAPACITY OF 120 MILLION GALLONS DAILY.

	Sand Filters.	Mechanical Filters.
Coagulating and settling basin and appurtenances, including land damages......	$370,000	$370,000
Filters and appurtenances, including land damages	1,540,000	900,000
New covered filtered-water reservoir.......	150,000	150,000
	$2,060,000	$1,420,000
Add 15 per cent. for engineering and contingencies	309,000	213,000
Total..................................	$2,369,000	$1,633,000

REVISED ESTIMATES OF COST OF CONSTRUCTION OF SAND AND MECHANICAL FILTER PLANTS WHEN DELIVERING 90 MILLION GALLONS DAILY.

	Sand Filters.		Mechanical Filters.	
	Per Million Gals.	Per Annum.	Per Million Gals.	Annum. Per
Labor, supplies, care of roads, grounds, fuel, lights and wash water	$1.25	$41,200	$1.00	$33,000
Office, laboratory and general expenses	0.70	23,000	0.70	23,000
Coagulant	0.95	31,500	1.57	52,500
Special labor for coagulant........	0.25	8,200	....	....
Sterilizing chemical	0.10	3,300	0.10	3,300
Totals......................	$3.25	$107,200	$3.37	$111,800

If we add five per cent. per annum on the estimated investment above given, to cover interest charges and extraordinary depreciations, the revised total yearly cost for the two types of filters is as follows:

Per Annum.	Sand Filters.	Mechanical Filters.
Operation and maintenance	$107,200	$111,800
Interest and depreciation	118,450	81,650
Totals	$225,650	$193,450

Conclusions and Recommendations.

Taking into account all of the data bearing upon the filtration of the proposed new water supply from the Gunpowder River at Loch Raven, I conclude, without any qualifications whatever, that a mechanical filter plant located either in the valley of Mine Bank Run or near Lake Montebello, when well built and well operated, will give a thoroughly satisfactory quality of filtered water, hygienically and with respect to appearance, tastes and odors, and its effect upon the distributing pipes; that its results will be fully equal to those which could be secured by a first-class sand filter plant; that it will be somewhat more manageable than a sand filter plant when treating the varying conditions of water which will be drawn from the new impounding reservoir; and that its cost will be less.

I recommend the adoption of a mechanical filter plant, with all necessary appurtenances for the treatment of the future water supply of Baltimore.

Very truly yours,

George W. Fuller.

APPENDIX No. 2—FILTRATION DIVISION

Report of Tests on Experimental Filter.

Object.

These experiments were carried on by the Filtration Division of the Baltimore City Water Department, under the direction of J. W. Armstrong. The purpose was to determine whether or not it would be safe to omit the brass wire screen between the sand and gravel layers usually employed in filters using high rate of wash. In the Baltimore filters now under construction, it is planned to use a rate of wash of about two cubic feet per square foot of sand area per minute. These experiments were carried on primarily to show whether or not any movement would take place in the upper layer of gravel when washing at varying rates between 1½ feet and six feet vertical rise per minute.

Apparatus.

The apparatus consisted of a filter tank, piping and fittings. The tank was three feet six inches by three feet nine inches inside dimensions, built of two-inch yellow pine, tongue and groove boards, painted with asphaltum paint, after erection. A gutter, of the same size as that to be used in the completed plant was built into one side of the bank as shown on the sketch. Two windows of seven-inch clear width were set into the side of the bank opposite the piping, and gave a clear view of the gravel layer. The lower window extended from about 1½ inches to about three feet one inch above the bottom, this being sufficient for the necessary observation. A three-inch supply pipe furnished water at from 115 to 125 pounds pressure (per gauge). This supply branched, a two-inch pipe being taken off for filtering, and a three-inch for washing. The filter line was not used to any extent during the test. The three-inch wash water pipe supplied the six-inch manifold. A valve and a Gem meter reading to cubic feet were inserted in the three-inch line. The supply was distributed by seven 1½-inch laterals, spaced six inches center to center; each lateral contained a single row of 14 holes spaced at 2½ inches, drilled and reamed to 7-32 of an inch. There was sufficient play to permit these laterals to be turned through a 180-degree, so that the jets pointed either upward or downward, as desired. A five-inch pipe, whose bottom of invert was at the level of the lowest point of the gutter, led the wash water through a five-inch waste to a sump. As most of the readings were taken at night, it was necessary to illuminate more fully than ordinarily. An arc lamp was suspended over the tank and a 16-candlepower, good reflector was hung before the window. The reflector threw a good light on the gravel next to the window, and when suspended inside the tank, and just above the gutter, gave a good view of the interior of the tank. The gravel was delivered in sacks, graded to the following sizes:

Passing a 3-inch mesh, retained on 1 inch.
Passing a 1-inch mesh, retained on ⅝ inch.
Passing a .⅝-inch mesh, retained on ⅜ inch.
Passing a ⅜-inch mesh, retained on 3/16 inch.
Passing a 3/16-inch mesh, retained on No. 10.

For grading the gravel there were a series of circular hand sieves with the following size meshes: 1-inch, ⅝-inch, 7-16 inch, ¼-inch and No. 10.

Procedure.

For the first series the gravel was used as shipped. For the following tests it was necessary to grade the gravel before beginning the series. The gravel was then placed in layers to correct depth, screened and leveled. No sand layer was used. There were two methods of observation: For the first four series water was admitted at approximately the rate desired; a reading of the meter was taken and the action of the gravel observed for from five to fifteen minutes, depending upon the movement; a second meter reading was then taken to give the quantity passed. For most of the readings a stop-watch was used, while in the other cases an ordinary watch, reading to seconds, was used. The valve was then adjusted for a new rate and the above procedure repeated for as many rates as were desired. For the last three sieves the valve was gradually opened by an operator who remained by it during the test. The observer signaled to the operator to hold the valve at such openings as caused movements in the gravel layers. By adjusting the flow, the rising velocity which caused motion in the gravel was determined. Whenever the movement of the gravel was noteworthy, meter readings were taken to determine the rate. After each series, or whenever the gravel seemed unusually disturbed, the filter was drained and the bed examined for holes, fissures, or other surface disturbances.

Description of Tests.

Series 1—For the first test, the openings in the laterals were turned downward. The size and thickness of the gravel layers was as follows:

Eight-inch depth of material passing a 3-inch screen and retained on a 1-inch screen.

Three-inch depth of material passing a 1-inch screen and retained on a ⅝-inch screen.

Two-inch depth of material passing a ⅝-inch screen and retained on a ⅜-inch screen.

One and one-half inch depth of material passing a ⅜-inch screen and retained on a $\frac{3}{16}$-inch screen.

Rates of 1.51 and 1.78 feet vertical rise per minute had no effect on this arrangement. The three-sixteenth inch layer of material being too coarse to properly support a sand layer, a layer of material, grading between three-sixteenth inch and No. 10, was added for the remainder of the tests.

Series 2—During the second test, the laterals opened downward. The following thickness of gravel were used, the grading being approximate and the error being less than one-sixteenth inch from the given size for any case:

Four-inch depth of material passing a 3-inch mesh and retained on a 1-inch mesh.

One and one-half inch depth of material passing a 1-inch mesh and retained on a ⅝-inch mesh.

One-inch depth of material passing a ⅝-inch mesh and retained on a ⅜-inch mesh.

Three-eighths inch depth of material passing a ⅜-inch mesh and retained on a $\frac{3}{16}$-inch mesh.

One and one-quarter inch depth of material passing a $\frac{3}{16}$-inch mesh and retained on a No. 10 mesh.

At the rate of 4.63 feet vertical rise per minute, gravel particles rose about one-half inch, as if over a jet, and fell back into original position. Fissures seemed to exist, as boiling action was localized. The particles which moved were apparently mica or very coarse sand, other particles remaining in equilibrum. As the rate was increased to 6.28 feet vertical rise per minute, the disturbance was localized but violent, the particles rising one inch vertically in extreme cases, and falling back into place. Some centers of disturbance were constant and others intermittent. The disturbance seemed to radiate from these spots, which were about two inches to three inches apart. As the rate was reduced to 5.20 feet vertical rise per minute, the gravel became quieter, isolated grains rising at intervals. As the rate was further reduced to 3.73 feet vertical rise per minute, there was no apparent movement, other than a shifting of a particle from side to side at long intervals. As the bed was drained after this series, it was noted that coarse sand and mica had deposited on the upper gravel layer, some sand having penetrated this layer a very short distance (one-eighth inch or less).

Series 3—The laterals were then turned so that the openings were directed upward. The gravel was replaced as in the preceding series. Note that the gravel depth is from the bottom of the tank, and not from the top of the laterals, which would give the effective depth. The rate of 3.14 feet vertical rise per minute produced no disturbance other than a slight shifting due to the rise of mica and sand grains from the lower layers. As the rate increased to 3.75 feet vertical rise per minute, there was general disturbance along the side of the tank, due to particles forcing their way up through the upper layer. At a rate of 3.87 feet vertical rise per minute, spots appeared in the area, but became intermittent and quieter after a few minutes' run. This continued through the rates of 4.35 and 4.92 feet vertical rise per minute, at which latter rate the surface agitation became general, though more violent at the glass than elsewhere. The gravel fell back into place after a maximum rise of one-half inch in extreme cases, some particles being barely disturbed. Agitation became less after a few minutes' run.

Series 4—The laterals were left in the upward position, and the gravel layers changed to the following depths, measured from the top of the laterals:

Five-inch depth of material passing a 3-inch mesh and retained on a 1-inch mesh.

Three-inch depth of material passing a 1-inch mesh and retained on a ⅝-inch mesh.

Seven-eighths inch depth of material passing a ⅝-inch mesh and retained on a 7/16-inch mesh.

Two and seven-eighths inch depth of material passing a 7/16-inch mesh and retained on a ¼-inch mesh.

One and one-quarter inch depth of material passing a ¼-inch mesh and retained on a No. 10 mesh.

Beignning with a rate of 1.47 feet vertical rise per minute, there was no movement until the rate of 3.51 feet vertical rise per minute was reached, at which point there was a slight vibration of finer particles of the upper layer, but no rising. At the rate of 3.96 feet vertical rise per minute, particles of mica rose, and pieces of gravel forced their way up through the upper layer, rising about one-eighth inch and falling back into place. There were several jet-like spots over the area, but most of the disturbance was at the glass. At the end of run the bed showed a hole about one-half inch in diameter through the upper layer. Some very fine material appeared banked in slightly raised spots.

Upon increasing the rate to 4.84 feet vertical rise per minute, some small particles from the seven-sixteenths inch to one-quarter inch size layer pushed their way up into the upper layer. There was agitation over the area, but mostly at the glass, where particles rise about three-sixteenths inch vertically and return to place. Upon draining, the bed showed more pronounced banking of very fine material. The finest material was again in banks or windows, showing lighter than exposed coarse material. The height of this fine material, which was smaller than No. 10, was unappreciable.

Series 5—The preceding test was repeated with the laterals upward and the gravel layers in the same position as before. Beginning at a rate of 1.14 feet vertical rise per minute, there was no movement until a rate of 2.47 feet vertical rise per minute was reached, at which time there was a little vibration of the particles which ceased, however, after a few minutes' run. The gravel was still undisturbed at a rate of 2.99 feet vertical rise per minute. At a rate of 3.07 feet vertical rise per minute, there was a slight vibration of particles, but no change in position. At 3.43 feet vertical rise per minute, there was a slight sidewise motion in the smaller particles, but no rising. At a rate of 3.93 feet vertical rise per minute, the gravel was on the point of rising. At the rate of 4.20 feet vertical rise per minute, the gravel was like gently boiling water. At the rate of 5.34 feet vertical rise per minute, the gravel boiled in intermittent spots, afterward falling back into place.

Series 6—The laterals were left opening upward, as in the preceding series, and the gravel layers changed to the following thicknesses; depths being measured from the top of the laterals:

Four and one-quarter inch layer of material passing a 3-inch mesh and retained on a 1-inch mesh.

Two and one-half inch layer of material passing a 1-inch mesh and retained on a ⅝-inch mesh.

One and three-quarters inch layer of material passing a ⅝-inch mesh and retained on a 7/16-inch mesh.

One and one-half inch layer of material passing a 7/16-inch mesh and retained on a ¼-inch mesh.

One inch layer of material passing a ¼-inch mesh and retained on a No. 10 mesh.

At the rate of 4.31 feet vertical rise per minute, there was considerable boiling at the glass and over the area. As the valve was closed to a rate of 4.04 feet vertical rise per minute, the gravel bubbled in well-defined jets. Upon further closing, bubbling ceased at the rate of 3.94 feet vertical rise per minute, though there was still a slight vibration of the particles. Upon reopening the valve, bubbling recommenced very gently, in jets at the rate of 4.23 feet vertical rise per minute. At a rate of 4.26 feet vertical rise per minute, the boiling was general and violent, but the particles fell back into their original position. There was no movement in the seven-sixteenth to one-quarter inch size, showing the coarser material.

Series 7—With the laterals opening upward and the gravel layers left in the same beds, the above tests were repeated. The valve was slowly opened until a rate of 4.29 feet vertical rise per minute was reached, at which point bubbling began immediately. Upon opening further to a rate of 4.70 feet vertical rise per minute. the jetting became general. There were many disturbed spots, but their activity varied from time to time. The valve was then opened to the maximum, giving a rate of 5.29 feet vertical rise per minute. The boiling action was not severe, the fine gravel particles varying not over three-sixteenth of an inch and falling back into place. This disturbance was confined to the upper layer.

Conclusions.

In reviewing the foregoing tests, it should be noted that the disturbance was probably greater in the tank than it would be in a standard size filter tank, due to the high ratio between area of tank size and area of filter bed. The smooth side of the glass window also probably increased disturbance immediately before it, due to reduced friction. After repeated tests on the same layer of gravel, the rate when agitation begins was materially raised, due probably to the washing out of the mica and sand grains which were in the lower gravel layers.

With the laterals opening downward, it would be safe to use a rate of 3.75 feet vertical rise per minute. Higher rates could probably be used, as the agitation under the rate of 5.20 feet vertical rise per minute affects only the upper half-inch or less of the finest layer, and that only in spots. Sand would probably find its way into the finest layer for a depth of from one-quarter to one-half inches in spots, though probably not deeper than one-eighth inch on the average. If there is any possibility of getting a wash at a rate greater than from 3.5 to 4.0 feet vertical rise per minute, the finer layer should be at least 1¼ or 1½ inches thick.

With the laterals opening upward, it appears that the thicknesses of the lower layers of gravel have little to do with its stability. In Series 3 there was but 1¼ inches of the coarsest gravel effective over the laterals, with a rate of 3.75 feet vertical rise per minute when the particles of gravel began to rise slightly in the upper layer. An increase to five inches effective depth for the coarsest layer, in Series 4 and 5, gave a rate of 3.96 and 3.93 feet vertical rise per minute, respectively, with the finest layer kept at 1¼-inch and the intermediate layers strengthened. Decreasing the lowest layer to 4¼ inches, effective depth, and decreasing the upper layer one inch with proportional decreases in the intermediate layers, gave rates of 3.94 and 4.29 feet vertical rise per minute, respectively, when bubbling began, for Series 6 and 7.

From the above it appears that the layers as used in Series 6 and 7 are the more economical, being more efficient in operation and cheaper in cost of material, than the gravel thicknesses used in Series 4 and 5. The finest sizes of gravel are much more expensive than are the coarser sizes. However, the agitation is somewhat less under higher rates of wash for Series 4 and 5 than for Series 6 and 7.

All of the gravel layers over laterals opening upward could be washed at a rate of from 3.75 feet vertical rise per minute to 4 feet without disturbing them, though Series 3 is not satisfactory under high washes.

Series 2 illustrated the action of sand under high rates of wash. At the close of the test, there was a thin layer of sand in top of the finest gravel layer, and not extending more than one-eighth inch into it. This sand had been washed up from the lower layers, which were somewhat sandy, by the higher rate of 6.28 feet vertical rise per minute. This rate caused greater agitation in the upper gravel layer than did any other wash noted, and the action of the sand may be taken as a representative of the worst mixing that would occur in any of the above tests.

Respectfully submitted,

(Signed) Frank Fame, Jr.

TABULATION OF THE ACTION OF GRAVEL UNDER VARIOUS RATES OF WASHING.

Series No.	Style.	Laterals Opening Upward or Downward.	Rate of Vertical Rise per Minute.	Movement of Gravel.
1	A	Downward.......	1.51	No movement.
			1.78	No movement.
2	B	Downward.......	4.63	Boiling in jets, rising about ½″ in extreme cases.
			6.28	Boiling localized, but violent; 1″ in extreme cases.
			5.20	Boiling gently, isolated grains rise in extreme cases.
			3.73	No apparent motion, except at long intervals.
3	B	Upward..........	3.14	Slight shifting of grains.
			3.75	Slight agitation near glass.
			4.92	Boiling general, ½″ rise in extreme cases.
4	C	Upward..........	1.47	No movement.
			3.51	Slight vibration of finer particles.
			3.96	Particles of mica rise, slight boiling.
			4.84	Boiling over entire area, rising $\frac{3}{16}$″.
5	C	Upward..........	2.47	No movement.
			2.99	No movement.
			3.07	No movement.
			3.43	Slight sidewise motion.
			3.93	Particles on point or rising.
			4.20	Like gently-boiling water.
			5.34	Boils intermittently in spots.
6	D	Upward..........	4.31	Considerable boiling over entire area.
			4.04	Bubbles in well-defined jets.
			3.94	Bubbling ceases, slight vibration.
			4.23	Bubbles in jets.
			4.26	Bubbling general and violent.
7	D	Upward..........	4.29	Bubbling begins intermittently.
			4.70	Jetting becomes general.
			5.29	Boiling not severe, $\frac{3}{16}$″ rise in extreme cases.

EXPERIMENTAL FILTER TANK

APPENDIX No. 3—FILTRATION DIVISION

Experiment to Test the Strength of Brass Strainer Plates.

Object.

The object of this test was to determine the strength of the semi-elliptical brass strainer plates, as proposed for use in the filter plant.

Apparatus.

The apparatus used for breaking the plate consisted of two cast-iron stands, which supported two three-inch channels, riveted together and separated by steel plates. The plate to be tested was made of commercial sheet brass, 30 inches long, No. 15 Browne and Sharpe gauge. It was bent to the form of a semi-ellipse, whose major diameter was four-inch and whose rise was 1¾-inch. The brass plate had three 21-32 inch holes drilled through it, 11½ inches from center to center. The plate was suspended by five-eighths inch bolts passing through the two outer holes, and the load was applied by means of five-eighths inch hook bolts, which passed through the center holes and was supported by cross-bar of three-quarter by one and one-half inch steel. The brass plate had its concave side turned upward. In order to keep it from flattening out under the weight of the loads, one-quarter inch by one inch bars were clamped along its edge at four points by one-inch by one-quarter inch clamps.

The one-quarter-inch by one inch bars were cut at the center point and separated so as to permit the brass plate to bend freely. The hook bolt that carried the load was supported by three-quarter inch by one and one-half inch bar-iron, resting on top of the brass strainer plate. It had four pins inserted into it, which prevented the strainer plate from spreading. A 12-inch valve bonnet suspended by a chain was used for supporting the load which was applied in the form of pig lead.

First Experiment.

The first plate to be broken was a No. 15 Browne & Sharpe gauge. Under the initial load of 179 pounds the plate deflected one thirty-second of an inch at the center. Under load of 244 pounds, it deflected one-sixteenth of an inch, and under load of 309 pounds, it completely failed by bending at the center, the upper edge of the plate buckling inward. It was found that this plate was annealed in the process of bending and its strength was thus greatly reduced.

Second Experiment.

This plate was also No. 15 Browne & Sharpe gauge, 30 inches long, supported and loaded in the same manner as the previous one. On application of the initial load of 179 pounds there was an apparent deflection of one-sixteenth of an inch, but this deflection must have been due to improper adjustment of the plate, as it only settled one sixty-fourth of an inch when a load of 369 pounds was applied. With the application of each additional load, a further deflection of one sixty-fourth of an inch was noted, until a weight of 777 pounds was reached, when a slight buckling was noticed at about the center point of the plate. On the application of a load of 847 pounds the plate failed completely by buckling at the center.

Third Experiment.

The third test was made on a brass plate 29 inches long, made of No. 12 Browne & Sharpe gauge, bent, supported and loaded in the same manner as the other plates. There was no deflection upon application of the initial load of 179 pounds, nor upon a load of 244 pounds. With the addition of each new pig lead which weighed from 65 to 70 pounds, deflection increased from one sixty-fourth to one thirty-second of an inch until 515 pounds was reached, and upon application of 580 pounds the plate failed completely by buckling at the center. This plate was injured by annealing prior to the process of rolling, which accounts for its very low strength.

Conclusions.

The strainer system, as planned for the Baltimore filters, will have the brass strainer plates held in position by one-quarter inch brass "U" bolts, spaced 11 inches from center to center. In applying the wash water they will be stressed uniformly in an upward direction due to impenging of the water against the plates. The "U" bolts will act as supports. As it is not possible to make a test under actual operating conditions, it was decided to take double the space and apply the load at the center. A length of 23 inches between supports was used instead of 22 inches, in order to make allowance for the cross-bar supporting the load. The load and distance between the supports of the test piece were such that the bending moment developed was approximately four times greater than could be obtained with a similar load applied under actual operating conditions.

It will thus be seen that Plate No. 2, which is the only one broken that gave a fair test, would have safely withstood a load of a little over 3,000 pounds had it been tested under the conditions that obtain in actual operation. This gives a factor of safety of between seven and eight.

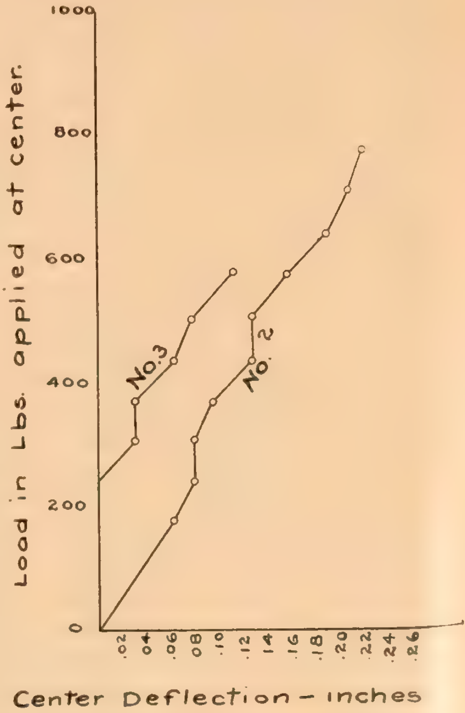
Test No. 1—No. 15 B. & S. Gauge.

Test No. 2—No. 15 B. & S Gauge.

Test No. 3—No. 12 B. & S Gauge.

Test pieces No. 1 and No. 3 were annealed before rolling to shape, which accounts for their low point of failure.



REPORT OF THE GUNPOWDER SUPPLY IMPROVEMENT DIVISION

BALTIMORE, December 31, 1913.

EZRA B. WHITMAN, ESQ.,
Water Engineer,
City Hall.

DEAR SIR—Herewith is submitted a report of the operations of this Division during the past year:

Office Force.

The office force prepared plans and specifications, etc., as follows:

Design for stadia rod.

Plan for blow-offs on new steel conduit at Loch Raven.

Eight supplementary plans, showing changes in and details of new Loch Raven Dam (Contract No. 1).

Plans and specifications for construction of Providence road, connecting Road No. 1 with Providence.

Plans and specifications for lining the Loch Raven end of the Gunpowder Tunnel.

Plan for register house for Venturi meter on new conduit.

Plans and specifications for masonry for Bridge No. 2.

Supplementary plans for masonry of Bridge No. 2, on lines recommended by Mr. J. E. Greiner, who was retained as consulting engineer.

Plans for storm water drains at keeper's house, Loch Raven Dam.

Plans and specifications for distribution mains between Filtered Water Reservoir and Clifton Gate House.

Plans and specifications for large valves to be placed in connection with distribution mains.

Property plats.

Various minor plans, sketches and studies.

Field Work.

Field work included property surveys of ten parcels of land in the Gunpowder Valley, aggregating 495.7 acres of land; outline surveys of 349 acres of woodland and topographical surveys covering 518 acres of city property.

Surveys were also made for the Providence road, for Road No. 3, for Road No. 4, for changes in Merryman Mill road, and for tentative location of future road west of Bridge No. 2.

Clearing Reservoir Site.

In January a force of men was put to work at clearing the reservoir site below elevation 200, and at this date the work has been carried to a point about 5,000 feet below the Merryman Mill Dam. Many large trees overhung the river bank and the removal of these has been tedious and expensive. The clearing should be completed early in the year, when there will remain the burning of smaller stuff and trash and removal of muck, where below the flow line, to make the basin ready for submergence.

Contract No. 1—New Loch Raven Dam.

Work on the construction of the new Loch Raven dam has gone forward with few interruptions due to high water throughout the year.

The west cofferdam was flooded on March 28, causing one of the derricks to settle, but aside from a few days delay in the work, the construction was uninjured. In April the work was again flooded, but without damage other than delay.

The east cofferdam was completed in May, but owing to defects in the construction of the west bulkhead of the cofferdam, permitting excessive leakage, the contractors were unable to unwater the pit. This bulkhead was constructed on the apron of the new dam by placing clay and other material between parallel walls of two-inch plank, tied together by wire rope and supported on the outside by large stones placed with the derricks. The leakage occurred between the filling and the concrete apron and was probably due to use of poor material or carelessness in placing, or both. After various attempts had been made to stop the leaks by puddling, grouting, etc., the contractors built a concrete wall on the inside of the cofferdam, against the bulkhead, which accomplished the desired end.

On August 6 Resident Engineer J. T. Todd resigned to accept the position of superintendent of construction for the contractors; on the dam and under his management the progress of the work has been very satisfactory. Mr. E. L. Pattison was made resident engineer on the dam in Mr. Todd's place.

On November 15 a slide occurred at the east end of the excavation, bringing down into the pit from the hillside about 2,500 cubic yards of material, mostly rock; the removal of this material has delayed the construction and necessitated the replacement of two derricks and a part of the contractor's trestle. Fortunately, the conditions were such that the slide was anticipated in time to enable the contractors to take certain precautions looking to the safety of their men and plant, and no one was injured.

The gate house has been completed up to floor level (elevation 202.0), and sluice gates are in place. The chambers will be floored over and the gate stands will be placed in position probably by March 1, 1914.

The spillway section has been completed for a length of 54.0 feet and brought up to elevation 183.0 for a length of 160.0 feet.

The west shore section is rapidly nearing completion, and with good weather, should be finished in February.

At the east end the cut-off trench and foundation pit is being excavated between the end of the dam and a point 144 feet east of the center of the spillway, to which point all masonry lying below elevation 167.0 is in place.

During the year 1913, 32,659 cubic yards of rock and earth were excavated and 38,501 cubic yards of concrete were placed, which, with work previously done and other items of construction, make the total value of the work done to date $371,039.50.

With not too unfavorable conditions through the winter we should be in a position to close the relief openings in the dam and begin to impound water some time in April.

Contract No. 2—Masonry for Bridge No. 1.

This contract was completed by Messrs. Williams and Straus, subcontractors to the Singer-Pentz Company, on July 3. The work presents a very pleasing and substantial appearance, and the contractors are to be commended on the results secured.

The value of the contract was $25,701.52.

Contract No. 3—Steel Pipe Conduit.

With the exception of some little smoothing up and patching of the invert of the lining, the conduit has been completed.

This contract was prosecuted by Mason, Hilton & Co., the contractors, in a systematic and workmanlike manner, that deserves commendation, and with the exception above noted, the construction has been entirely satisfactory.

The lining was placed by the New York Cement Gun Company, sub-contractors, by means of the "cement gun." In "shooting in" the invert proper, precautions were not taken to dispose of the "rebound" or loose grains of sand, which rebound from the steel and which at many points created pockets of sand in the lining; also the workmen were allowed to walk over the invert before the cement had taken its set, so that patching and grouting is necessary at these points. The arch presents a very fair appearance. The value of the contract was $157,559.90.

Contract No. 5—Venturi Meter.

Contract for this meter was awarded to the Builders Iron Foundry of Providence, R. I., on their bid of $5,420.

The meter tube was placed by Mason, Hilton & Co., in connection with the construction of the conduit, and the recording and registering apparatus will be installed by the contractors on notification from this office to do so.

As we cannot use the conduit until the lining is placed in the Gunpowder Tunnel this fall, the Foundry has been requested to delay the installation of the recording and registering apparatus until a later date. This work can be done within two weeks and is not affected by weather conditions.

Contract No. 6—Superstructure Bridge No. 1.

This contract was awarded to the Roanoke Bridge Company on March 12, at their bid of $50,915.

In July the contractors had a small force in the field excavating for anchorage for the cables upon which the falsework trusses are to be erected. Excavation and drilling of holes for eye-bar anchors was completed in November, and the twelve cables on which the false work trusses are to rest were stretched across the valley between abutments. At this date all of the steel and lumber has been delivered on the ground, and about 50 per cent. of the falsework bents have been erected. We estimate that the falsework will be completed about February 10.

A careful inspection of the steel work disclosed a number of loose rivets, badly matched holes, and other minor defects in workmanship, which must be corrected before the steel is lifted to the falsework, but as yet no attempt has been made to remedy these.

Progress on this work has been far from satisfactory, due, the contractors claim, to trouble in securing labor and unforseen diffialties in reaching a character of rock that would be suitable for their cable anchorages. There is some foundation for both of these claims, but notwithstanding, it is the opinion of the writer that work should have been done in a much shorter time.

Judging by past performance, this bridge will not be completed before May 1, 1914, at the earliest, though the contractors' time expired in November.

Contract No. 7—Road No. 1.

This contract for the construction of about 1.9 miles of new road along the west side of the Loch Raven Valley was awarded to Thomas Mullan on April 30, 1913, at his bid of $47,649.50.

On June 11 ground was broken by the steam shovel at Station 51, just north of the new Loch Raven dam. At this date the shovel has advanced to the west abutment of Bridge No. 1, taking out the full width of roadway, except where in very heavy cuts, and has taken out the full width on its return, for a distance of about 1,000 feet.

A supplementary contract has been entered into with Mr. Mullan for the construction of the Providence road, about 1,800 feet in length. This road wiil connect the Lake Drive with Providence and Towson, and will be the most direct route to Towson from Bridge No. 1.

In order to allow embankments along the new road to settle before placing the macadam thereon, and with the approval of the county roads engineer, Mr. William G. Sucro, it was agreed that the contractor should place no macadam until spring, and the time of completion of Road No. 1 and the Providence road was extended to forty working days after April 1, 1914.

All culverts have been completed, and about 24,000 cubic yards of material have been excavated, at a cost of $22,525.18.

Contract No. 8—Sluice Gates for New Loch Raven Dam.

This contract was awarded to the Coffin Valve Company of Boston, Mass., on February 19, 1913, at their bid of $3,246, covering four 42 by 72 inch gates, two 48-inch diameter gates and four 24-inch diameter gates, together with stems, guides and stands.

These gates are to be placed by the King-Ganey Contracting Company, under Contract No. 1, and all have been placed except one of the 48-inch gates, which closes the east sluiceway of the dam not yet completed.

Contract No 10—Forty-eight Inch Gate Valves.

This contract was awarded to the Coffin Valve Company of Boston, Mass., on March 5, 1913, at their bid of $1,620, for two gates.

The gates were delivered several months since, but have not as yet been put in position on the sluices through the dam, which work is to be done by the King-Ganey Contracting Company under Contract No. 1.

Contract No. 15—Superstructure Bridge No. 2.

The contract for this bridge, consisting of three 207-foot through riveted truss spans and two 27-foot approach spans, designed in the office of Mr. J. E. Greiner, consulting engineer, was awarded to the McClintic-Marshall Company of Philadelphia, Pa., on September 17, 1913, at their bid of $86,750.

At this date shop drawings have been approved by Mr. Greiner, and orders have been placed with mills for materials.

Contract No. 16—Masonry, Bridge No 2.

This contract was awarded to Stewart-Jones Company and Claiborne-Johnston Company of Baltimore, on June 11, 1913, at their bid of $24,785. Subsequent to this award, certain changes were made in the designs, on recommendation of Mr. J. E. Greiner, who was called in as consulting engineer, which added materially to the unit cost of the concrete in place. To cover this additional cost, an agreement was entered into with the contractors by which their original price of $8.90 per cubic yard for concrete was increased to $10.50 per cubic yard.

This work has gone forward in a very satisfactory manner, and with very creditable results. At this date the west abutment and Piers Nos. 1, 2 and 3 have been completed; the east abutment is well under way, and the foundation pit for Pier No. 4 is about ready for concrete.

One thousand three hundred and fifty-five cubic yards of material have been excavated and 2,116 cubic yards of concrete have been placed; the value of the work done being $25,565.14.

Contract No. 17—Distribution Mains.

This contract for distribution mains extending from the filtered water reservoir now under construction, to Clifton gate house and including a branch line 1,700 linear feet long extending down Harford avenue to the Baltimore and Ohio Railroad, was awarded to the Lock Joint Pipe Company of New York on December 31, 1913, at their bid of $225,924.97, for reinforced concrete pipe. The lowest bid for steel pipe, submitted by the same Company, was $352,539.04, a difference of $127,000 in favor of concrete pipe.

This Company has made numerous tests of concrete pipe under pressures greatly exceeding the pressure to be sustained by the pipe to be laid under this contract and has also designed a joint which should satisfactorily take care of contraction and settlement.

The tests above mentioned confirmed results secured by this Department in similar tests made in 1912, and demonstrated the entire practicability of constructing a reinforced concrete pipe capable of sustaining internal pressure of 50 pounds or more without leakage; while the bids submitted indicate a very considerable saving in this type of construction over steel pipe.

Contract No. 24—Road No. 3.

This contract was awarded to Thomas Mullan on September 24, 1913, at his bid of $31,566.91 for a concrete surface 14 feet in width.

A small amount of grading has been done and crusher plant has been installed at the Department quarry on the property purchased from Rose Keech.

On January 13, 1913, the operation of the purification plants was turned over to the County Division and since that date this work has been done under the direction of Mr. Benthall.

In April several conferences were held with the County Commissioners and other interested parties in connection with the location of the proposed roads and bridges, resulting in an agreement on the part of the city to construct an additional bridge across the proposed lake at a point about 4,400 feet above Meredith's Ford Bridge, and to connect this bridge on the east with the Jarrettsville Turnpike near Mann's gate and the Dulaney Valley Turnpike near Dulaney Valley Postoffice, and on the west with the Merryman's Mill road, thus giving an outlet to Towson for traffic using these turnpikes after the Meredith's Ford Bridge is removed. This bridge is known as Bridge No. 2, and will be about 954 feet long over all.

In October an inspection was made of the lower end of the Gunpowder Tunnel, which will be under pressure when improvements are completed. This portion of the tunnel is through gneiss rock of a very satisfactory character and is unlined except for short sections at varying intervals. Test pits will be sunk at low points along the line to determine the depth and character of cover and unless these show insufficient cover, a small amount of grouting in the lined sections will serve to make this portion of the tunnel safe under the increased pressure.

One fatality occurred on the contract work. On July 27 an Italian employed by the King-Ganey Contracting Company was crushed to death by a dump car which he was attempting to unload and which fell back on him.

One man had his arm badly crushed in the gears of a hoisting engine.

Sanitary conditions have been good throughout the year and there has been no disorder in any of the various camps.

Yours very truly,

EMORY SUDLER, *Division Engineer.*

NOTE—Small figures to the right of the quantities denote the month of the year.

REPORT OF AUDITING DIVISION

BALTIMORE, December 31, 1913.

MR. EZRA B. WHITMAN,
Water Engineer.

DEAR SIR—I submit herewith the report of the Auditing Division for the year ending on the above date.

During the year this Division has been engaged in keeping the books of the Department, showing its accounts with outside parties and other departments of the city government, in keeping a record of all receipts and disbursements, in making up pay-rolls and paying off all employes, in ordering all materials, taking all inventories and keeping stock ledgers, in keeping a record of all work done on shop orders, checking and comparing all bills, drawing up all warrants and keeping a record of rents, insurance, etc.

Careful attention has been paid during the year to the placing of all orders for supplies required for the Department not covered by contract; competitive prices being always obtained except for small emergency orders.

Good results were again obtained from the system of accounts installed in 1900, the difference between the inventory of the Mechanical Division and the stock ledgers being $187.33 out of a total stock of $98,343.87, while the Construction Division inventory shows a difference of $3.96 out of a total stock of $6,189.42.

Four thousand and sixty-seven orders for materials were placed during the year, as against three thousand five hundred and eighty for 1912.

I present herewith the annual statements showing the assets and liabilities of the Department, the gross receipts and total disbursements, and disbursements from each of the ten appropriation accounts.

I again take pleasure in commending the work of the employes of this Division for the able, intelligent and conscientious manner in which they have performed their respective duties and their cheerful response to every request I have made of them.

Respectfully yours,

CHAS. W. NAGLE, *Auditor*

STATEMENT OF RECEIPTS AND DISBURSEMENTS FOR 1913

RECEIPTS.

Amount received from water rents	$831,553 82	
Less returned	3,958 43	
		$827,595 39
Meter rents		569,669 69
Plumbing bills		72,492 41
Meter plumbing bills		7,099 52
Interest		1,899 89
Turn-offs		280 50
Vacancies		513 00
Sales, old materials, rents, etc		9,494 25
		$1,489,044 65

DISBURSEMENTS.

Water Engineer's Department:		
Expenses	$535,205 46	
Meters	1,272 59	
Salaries	101,293 47	
Collector of Water Rents and Licenses:		
Expenses	2,034 43	
Salaries	29,836 67	
Interest	415,000 00	
Sinking funds	21,614 43	
		1,106,257 05
Surplus to general treasury		$382,787 60

APPENDIX No. 4.

Report on Failure of Groined Arches.

November 6, 1913.

Mr. Ezra B. Whitman, *President of the Water Board,*
Baltimore, Md.

Dear Sir—In accordance with your letter of October 25, 1913, stating that a failure of some of the groined arches in the filtered water reservoirs now under construction at Lake Montebello, Baltimore, had taken place and that you desired me to visit Baltimore and to report on the safety and adequacy of the design of the groined arches, to advise as to whether any changes from the original designs were necessary, to examine the work as it now stands and give my opinion as to the cause of the failure, and to advise as to what portions of the groined arches and barrel arches still standing should be taken down before proceeding with the reconstruction of the work, I beg to state that I spent all of Tuesday, Wednesday and Thursday, October 28, 29 and 30, in Baltimore at Lake Montebello making a detailed examination of the work and securing data regarding the methods of construction.

As a result of this detailed examination and of my subsequent investigations and studies I have reached the following conclusions:

1. That the groined arches were well and carefully designed and if built of the materials and in accordance with the requirements specified are safe and suitable for the purpose for which they were designed.

2. That the design of the groined arches is in accord with what may be said to be practically standard practice in this class of work and is similar to that adopted in a large number of works already built and in service in the United States, among which may be mentioned those in Albany, N. Y.; Columbus, Ohio; Grand Rapids, Mich.; Minneapolis, Minn.; New Orleans, La.; Philadelphia, Pa.; Pittsburgh, Pa.; Providence, R. I.; Roland Park, Md.; Springfield, Mass.; and Washington, D. C.

3. That no changes in the design of the groined arches be made and that the work be constructed as originally contemplated.

4. That the failure was due to the premature loading of the barrel arches and groined arches with earth before provision had been made for taking up the thrust produced in the same by the earth loading.

Before discussing the question of what portions of the groined arches and barrel arches still standing should be taken down prior to proceeding with the work of reconstruction, as well as the question of the repair and reinforcement of certain portions of the work which felt the effect of the failure but which are in such condition that it may be possible to strengthen them and thereby avoid the necessity of having to take them down, it will be well to first consider the design and construction of the work and the failure and its cause.

Design.

The groined arches which fell were built as a portion of the two filtered water reservoirs now under construction at Lake Montebello, Baltimore. The drawings and specifications for the work are given in detail in Contract No. 4, a copy of which will be found in the Appendix.

The reservoirs are each 241 feet wide by 258 feet 6 inches long, measured on the neat lines, and have a total depth from the floor to the inside crown of the arches above of 20 feet. With a depth of water of 17 feet, each reservoir has a capacity of approximately 7¾ million gallons, making a total combined capacity for the two reservoirs of about 15½ million gallons.

The reservoirs are of the covered type, the covering consisting of groined-arch vaulting with earth filling above, and are being constructed of concrete—a portion only of which is reinforced.

The concrete floor has a total thickness of 8 inches and is laid in two layers each 4 inches in thickness, except near the outside walls where the layers are somewhat thicker. The concrete in the lower and upper layers is placed in blocks approximately 15 feet square.

The pier bases, on which the piers carrying the vaulting above rest, are 5 feet square, are reinforced with steel and set on the lower layer of the floor. The piers are 18 inches square and are 16 feet 2 inches in height from the top of the pier base to the springing line of the groined arches.

The dividing wall between the two reservoirs is of reinforced concrete, having a thickness at a point 17 feet above the floor—that is, at the springing line of the groined-arch vaulting—of 18 inches and a thickness of 2 feet 3 inches at the floor. The reinforcement extends well up above the top of the wall to a point about level with the inside crown of the groined arches.

The outside wall is of the arched type and is somewhat similar in section to that used for the walls of a large aqueduct or sewer and is designed to transmit the thrust through the arch and abutment section to the foundation below. The arch of the outside wall has a thickness of 6 inches at the crown where it abuts against the groined arches.

The groined arches have a clear span of 13 feet 6 inches from pier to pier and a rise of 3 feet. The thickness of the arch at the crown is 6 inches and over the pier 21 inches. The introdos of the arches are semi-elliptical and the extrodos parabolic. The depression over the pier, measured from a plane passing through the outside crowns of the arches, is 21 inches.

On the easterly side of the reservoirs the earth covering is to have a depth of 2 feet 3 inches above the outside crown of the arches and on the westerly side a depth of only 1 foot 9 inches.

An investigation has been made to determine the amount of thrust in the arches under different conditions of loading, from which it has been found that the compressive stresses in the concrete are within the limits which can be allowed on concrete of the character used in the construction of the work. Similarly, the loads on the piers and on the foundations are within safe limits.

Groined arches of the type being built at Baltimore have been used extensively in the United States in the last ten to fifteen years for covering reservoirs and slow sand filters. In Table 1 is given data regarding a large number of groined arches actually built, but no attempt has been made to make the table include all of the groined arches constructed in the United States. The table does, however, give data regarding the arches in many of the most important works in this country and Canada.

From an examination of the table it will be seen that in some of the largest works the arches have a longer clear span than those being built at Baltimore, and it will also be seen that in nearly every case the crown thickness is 6 inches—the same as that of the arches designed for the filtered water reservoirs at Baltimore. Where the groined arches have been called on to support a load greater than that of the ordinary earth covering the crown thickness has been increased and in some cases the concrete has been reinforced with steel. Under conditions similar to those at Baltimore, however, the groined arches have not been reinforced.

For the purposes of comparison, sections of the groined arches and outside walls of the filtered water reservoirs at Baltimore, of the filtered water reservoir at the Upper Roxborough filter plant in Philadelphia, of the slow sand filters at the Belmont filter plant in Philadelphia, of the covered reservoir at Roland Park, Baltimore; of the filtered water reservoir at Columbus, Ohio; and of the slow sand filters at Toronto, all drawn to the same scale, are shown respectively on Plates 3 to 8 inclusive.

From an examination of these plates it will be seen that the arch of the outside wall of the filtered water reservoir at Baltimore down to the abutment section is almost identical with that of the outside wall of the filtered water reservoir at the Upper Roxborough filter plant in Philadelphia. The two filtered water reservoirs at Baltimore have a total area of 2.78 acres, while the filtered water reservoir at the Upper Roxborough filter plant has an area of 1.74 acres.

Again, it will be seen that the groined arches of the filtered water reservoirs at Baltimore, with a clear span of 13 feet 6 inches and a crown thickness of 6 inches, are almost identical with those of the Belmont filters at Philadelphia, which have a clear span of 13 feet 5 inches and a crown thickness also of 6 inches. The total area of the Belmont filters having such arches is 13.32 acres, while at Baltimore the area is only 2.78 acres.

At Columbus, Ohio, there are two filtered reservoirs which are very similar to those being constructed at Baltimore. The reservoirs at Columbus have a total area of 2.16 acres, compared with a total area of 2.78 acres at Baltimore. The arch of the outside wall at Columbus is in general similar to that of the outside wall at Baltimore. The groined arches at Columbus have a clear span of 15 feet 2 inches, a rise of 3 feet 2 inches and a crown thickness of 6 inches, while those at Baltimore have a clear span of only 13 feet 6 inches, with a rise of 3 feet and a crown thickness of 6 inches.

*Under construction.

Considering, then, not only the studies which have been made but also the large amount of similar work actually constructed and in service elsewhere, it is my opinion that the Baltimore groined arches, if built of the materials and in accordance with the requirements specified, are safe and suitable for the purpose for which they were designed. I see no reason for making any changes in the design of the groined arches and I recommend that the work be constructed in accordance with the present design.

Construction.

The concrete used in the groined arches was mixed in the proportion of 1 volume of Portland cement, 2½ volumes of sand and 5 volumes of gravel. In the other parts of the work the concrete was mixed in the proportions of 1 volume of Portland cement, 2 volumes of sand and 4 volumes of gravel.

All of the cement used in the work was tested at the Municipal Laboratory. The records show that of a total of 55 cars tested all except one car passed both the 7-day and 28-day tests specified. The one car referred to was held on the results of the 7-day tests, but passed on the results of the 28-day tests. The cement is stored in a dry warehouse, where it is well protected from the weather.

The sand and gravel used in the concrete is dredged from the bottom of Baltimore harbor, is transported in cars over the street railway system and is dumped into storage bins at night. The sand and gravel is the same material as that used very extensively throughout the city of Baltimore for concrete construction; in fact, it is said that it is used almost exclusively. The gravel is graded in size from a minimum of ¼ inch to a maximum of 2 inches in diameter. Until recently, the sand and gravel as delivered is said generally to have been clean, but in one or two of the deliveries recently made the materials were dirty and were condemned as unsatisfactory for use. At times small lumps of clay have been observed in the sand.

The concrete was mixed by machinery in a batch mixer and in general has been mixed very wet. For portions of the work the concrete has been transported in concrete buggies and for other portions of the work has been elevated and then transported through a long chute.

In placing the concrete in the groined arches forms in the shape of inverted pyramids were used to form the lower parts of the depressions over the piers. While these forms served to hold the concrete below them in place they did not always serve to hold the concrete in place immediately adjacent to them, especially when the concrete was very wet. As a result, when the concrete settled down, the upper portion of the concrete was worked back into place and this process was repeated, if necessary, until the concrete was sufficiently stiff to hold its position.

In a few places the groined arches are not quite of the full thickness called for. This is noticeable mainly at the haunch of the arch. The trouble is local, however, and was caused by the use of very wet concrete which settled down slightly in places after it had been put in to the proper thickness and before initial set took place. Similar conditions have been observed in other works which have been constructed. As the area over which the arch is less than the thickness called for is small and as there is a surplus of material in the section close by, the strength of the groin as a whole should not be materially affected.

The dates on which the piers, groined arches and barrel arches were built are given in Tables 2, 3 and 4.

Failure of the Groined Arches.

The failure of the arches occurred on Monday, October 20, 1913. at 7.30 A. M. Eye witnesses, one of whom was below and the other on the roof, agree in their description of the failure that the first break occurred near the crown of the arch between Piers 10 and 26. At this point the groined arches fell in, being followed almost immediately by the falling in of the other groined arches and the barrel arches. It has been impossible to secure from either of these two eye witnesses any detailed information as to the sequence of events after the first arch fell, as each of them was using every effort to reach a point of safety as rapidly as possible. A plan and section of the filtered water reservoir showing the failure is given on Plate 1.

An examination of the work shows that the concrete is of good quality and that the voids have been well filled. In many instances the gravel stones have been fractured where the concrete was broken at the time of the failure. In one or two places where the roof fell the concrete does not appear to be of as great strength as elsewhere, although it seems to have plenty of strength to withstand the compressive stresses to which it was or would have been subjected. It is impossible to determine now why this concrete is not of as good quality as the rest, but it may be due to overworking the concrete in keeping it in position on the centers adjacent to the form over the pier, to using a batch of concrete which had been held too long after mixing began before being placed, or possibly to the use of dirty material. In should be stated here, however, that the groined arches did not fail first at the point where this concrete was found. To determine whether the dirt which has occasionally been found in the sand or gravel is of such a nature as to appreciably decrease the strength of the concrete, if at all, I would recommend that a series of comparative tests of mortar briquettes and concrete cubes be made, using dirty material and the same material washed.

The concrete in that portion of the roof which fell, as well as in that portion of the roof still standing, but which has been damaged to a greater or less degree and from which the centers had been removed, was all placed between August 26 and September 25. During this period the records of the United States Weather Bureau show that there was no freezing weather and hence the concrete could not have been affected by the action of frost.

From my examination of the concrete not only in that portion of the roof which fell, but in that portion still standing, and also from investigation of the conditions under which the work was built, I am of the opinion that the failure was not due to poor concrete.

The centers used for the construction of the groined arches which had been completed up to the time of the failure are made of steel and are similar in form to the wooden centers used in some of the earlier groined arches which have been built in other cities, but differ from those which have been used most extensively. As set up, the main centers run north and south between the piers and are of such a form as would permit of the construction of a full barrel arch. These centers in turn support other centers running in an east and west direction and are cut to such a form as to rest on the first-mentioned centers, the two sets of centers together forming the proper mould for the construction of the groined arches.

The first centers were struck on September 16 under the barrel arch in the northwest corner of the reservoir, or 14 days after the placing of the concrete in the arch. The striking of the centers under the groined arches began on September 25 with the removal of the main centers between Piers 3 and 4, Piers 19 and 20 and Piers 35 and 36. The striking of the centers was then continued, working toward the west. It has not been possible to ascertain the exact date on which each center was struck, but notes which had been taken in the field give the total number of centers which had been removed up to certain given dates. In order to ascertain approximately the dates on which the several centers were struck I have assumed that the rate of progress of striking the centers during each period was uniform, taking into account the days on which centers were struck.

With this assumption, and it seems as reasonable a one as can be made under the circumstances, it appears that, in the area west of Groins 3, 19 and 35 and east of that portion of the roof which fell, the concrete in the several groins had been placed from 13 to about 30 days prior to the striking of the centers below.

The word "groin" is here used to define the monolithic block over the pier and bounded by the joints passing through the crowns of the barrel arches on the four sides of the pier. In Groins 3, 20 and 35 the concrete was placed 13 days, in Groins 37 and 38 it was placed 14 days and in Groins 19, 21 and 36 it was placed 15 days before the centers were struck. None of these groins fell, although cracks can be seen in all of them except Groin 3.

In that portion of the roof in which the full groins fell, and including also those groins still standing but of which a portion fell, it appears that the concrete had been placed in the groins from about 19 to 46 days prior to the striking of the centers below. In Groin 26 it appears that the concrete had been placed about 20 days and in

Groin 10 about 40 days prior to the striking of the centers. It was between Piers 10 and 26 that the first break occurred.

In Barrel Arches 3 and 4 it appears that the concrete had been placed about 18 and 26 days, and in Barrel Arches 5, 6, 7 and 8-N. & W. from about 32 to 41 days before the centers were struck, except in the northwest corner of Barrel Arch 8-N. & W., where the centers were struck 14 days after the concrete was placed. This portion of Barrel Arch 8-N. & W., however, does not appear to have been damaged.

In view of the fact that the centers under that portion of the roof which fell were not struck until at least 18 days after the concrete was placed, and many of them had been up much longer, the failure cannot be ascribed to the striking of the centers at too early a date.

On or about Tuesday, October 14, the embankment along the north wall of the reservoir was being made, the material being moved by drag scrapers; and on Thursday, October 16, the embankment was nearly up to the top of the barrel arch, sufficiently so that a wagon could be driven from the fill onto the groined arches, and a small covering had been made near the northwest corner of the reservoir. On Friday, October 17, filling in over the groined arches was continued and also for a period of about three hours on the morning of Saturday, October 18. No more filling was put on the arches after about 10 A. M. Saturday morning. The failure took place on Monday, October 20, at 7.30 A. M. Views of the failure are shown in Plates 9 to 20, inclusive.

The aproximate limit of the earth filling on that portion of the roof which fell is shown on Plate 1 and was determined from the outline of the earth lying on the floor, it having been assumed that the earth fell vertically. This, of course, is not strictly correct, as some of the earth was thrown sidewise when the arches tipped over. The limit of the earth filling on that portion of the roof which did not fall is also shown on Plate 1, it having been located soon after the failure.

By reference to Plate 1 it will be seen that the centers had all been removed under that portion of the roof which fell, with the exception of the westerly side of Groins 32 and 48. The elevations of the top of the earth fill along and adjacent to the north wall of the reservoir, taken shortly after the failure, are shown on Plate 2.

The exact depth of the fill on top of the arches cannot be determined, but it seems to be the concensus of opinion that the filling was carried out over the arches fairly level with the fill along the north wall, although it may have sloped off slightly towards the south. Examination of the earth filling still remaining on the arches on October 29, at the time of my first examination, seems to indicate that the fill did slope off somewhat toward the south.

The maximum depth of fill along the north wall was opposite Groins 10 and 11. The transverse section on Plate 1, through Barrel Arch 5 and Groins 10, 26 and 42, showing the depth of earth filling on the groined arches, as near as I have been able to ascertain, it was constructed by taking from Plate 2 the elevation of the fill at the north wall opposite Groin 10 and then assuming that the fill sloped off slightly to the south.

The effect of the earth filling on the roof was to produce a thrust not only in the barrel arch of the north wall, but also in the groined arches. No provision was made for taking up the thrust at the southerly end of the groined arches. The effect of the unbalanced thrust was, therefore, to tend to overturn the groins and piers in a southerly direction. The three piers with the groins and earth fill above have some stability, but their moments of stability against overturning are not sufficient to balance the overturning moment of the thrust applied at the crown of the arches.

While the groined arches will safely carry the earth fill if proper provision is made for taking up the thrust, they are not safe when loaded unless provision is made for taking up the thrust, for the reason that the unbalanced thrust allows the groins to act as cantilever beams supported at the center, thereby producing tension in the concrete on the upper side of the groin.

For example, consider Groin 10. If the thrust at E is unbalanced the section of the groins between E and C acts as a cantilever beam supporting not only the weight of the concrete itself, but also the weight of the earth filling above. Computations which have been made show that under such conditions the tension in the concrete on the upper side of the groin at the section C-D due to the weight of the concrete alone would amount to about 60 pounds per square inch and that the tension due to the weight of the concrete plus that of the earth fill would amount to about 210 pounds per square inch. It is evident, therefore, that the groins acting as cantilevers alone cannot be relied on to carry the weight of the earth fill.

From examination of the structure and from studies subsequently made it is my opinion that the failure was due to the premature loading of the barrel arches and groined arches with earth before provision had been made for taking up the thrust at the southern end of the groined arches, the effect of which was to cause some of the groins to fail which acting as cantilever beams and others to be overturned. When the groined arches next to the barrel arches failed the barrel arches failed also, as there was nothing to support them.

That a thrust, as well as a cantilever action, played an important part in the failure is borne out by a detailed examination of both the fallen and standing parts of the structure. Groins 6, 7 and 8, although still standing, are cracked in an east and west direction a short distance north of the piers at a point where the groins would be expected to fail if called upon to act as cantilever beams. The crack can be seen on Plate 15. Groins 44, 45, 46 and 47 all fell to the south, the centers standing just south of these groins not having served to prevent the groins from overturning. Piers 39, 40, 41, 42 and 43 all leaned to the south, although one or two of them have since been straightened up. Numerous other examples could be cited to show the effect of the thrust.

Groins 39 40, 41, 42 and 43 were prevented from overturning to the south by the steel centers which had been erected immediately adjoining them. Groin 43, shown on Plate 10, was taken down after the failure. Groins 52, 53, 54, 68, 69, 70, 84, 85 and 86, under which the steel centers are still standing, very materially served to stiffen that portion of the structure immediately to the north. In the northeast corner of the reservoir the centers are still standing and this part of the structure apparently felt the effect of the thrust the least. Taking the structure as a whole, including many of the piers to the south, it shows the effect of a thrust. A rather surprising fact is that the structure did not fail until almost two days after the earth fill had been placed.

Replacement and Repairs.

A careful examination of that part of the structure still standing was made to determine what portions of the structure were so badly damaged that they would have to be taken down and what portions could be repaired and strengthened. As the centers are still standing under certain portions of the work it was impossible to inspect the underside of the groins above and hence it is impossible at this time to determine definitely just what should be done to these groins.

Many of the piers are intact, except that there is a slight opening of the joint at the base. If the joint is not completely closed when the pier is straightened then the joint should be grouted. In order to grout the joints it may be necessary to block or wedge up the piers. Whether the result will be perfectly satisfactory will depend on how carefully the work is done. Great care must be exercised in doing this work and if there is any doubt whatsoever as to the strength of any pier, then, in my judgment, the pier should come down rather than take any chances.

Some of the groins still standing are so badly damaged and cracked that they must be taken down and rebuilt. Others are only slightly cracked, but may have to be taken down when groins immediately adjacent are taken down.

The remaining groins can, in my opinion, be sufficiently strengthened and reinforced. For this purpose, I would recommend that the depressions in the groins be filled with concrete and that at the same time a layer of concrete, having its upper surface level, be placed over all such groins—the concrete to have a thickness of not less than 4 inches and to be reinforced with steel rods running both north and south and east and wast. As with the piers, if there is a question as to the strengthening of any groin, the groins should be taken down rather than to take chances. Where a groin is to be taken down it will probably be found necessary to take down the pier also.

Subject to revision as the work proceeds, the repairs and replacements required are indicated in Table 5.

*Or take down.

The barrel arches of the north wall, east of that portion of the roof which fell, are probably all cracked longitudinally at or near the springing line, judging by the crack which was found in Barrel Arch 2 when a portion of the earth covering above the arch was removed. Otherwise the arches seem to be in good condition. The crack should be grouted. Those portions of Barrel Arches 5 and 7 still standing should be taken down. The easterly end of Barrel Arch 8-N. & W. should be taken down, but the westerly end can probably be saved. Whether this arch is cracked or not cannot be determined until the earth covering is removed. All barrel arches and groins must be supported while repairs and replacements are being made.

Acknowledgment.

In conclusion I wish to express my appreciation of the hearty co-operation which I have received at all times from the several city officials with whom I have come in contact and especially from yourself and Messrs. Armstrong, Purcell, Reeder and Horn. Every facility has been placed at my disposal to get at the facts as nearly as possible and all the records of the work have been open to my inspection.

Respectfully presented,

JOHN H. GREGORY,
Consulting Engineer.

APPENDIX No. 5

Baltimore City Water Department—Biological Laboratories.

LAKE MONTEBELLO, February 7, 1914.

MR. EZRA B. WHITMAN,
Water Engineer.

DEAR SIR—I respectfully submit herewith a report of the work done in the biological laboratories of the Water Department during the year ending December 31, 1913.

The largest portion of the work consisted of bacteriological examinations of samples of water taken daily, excepting Sundays and some holidays, from Lake Montebello influent and effluent, Lake Clifton influent and effluent, Hampden Reservoir influent and effluent, and Druid Lake effluent; daily readings of turbidity and apparent color of samples from the above places, excepting Lake Clifton influent and Hampden Reservoir influent; weekly chemical and microscopical analyses of samples from these places and from Lake Ashburton, Guilford Reservoir and High Service Reservoir; and weekly bacteriological analyses of samples from Lake Ashburton, Guilford Reservoir, High Service Reservoir, and from city taps representing the four systems of distribution.

The bacteriological examinations consisted of an enumeration of the bacteria growing at 20 degrees C. and those growing at 37 degrees C., and a systematic procedure for the differential isolation of members of the B. coli group of gas-producing organisms. The chemical analyses consisted of the usual determinations as shown in the tables of the results obtained. The microscopical examinations included determinations of the amount of microscopic organisms, or algae, and of amorphous matter, the results of both being expressed as standard units per cubic centimeter, although record of the predominating species of organisms was made.

In addition to this work, analyses were made of the hypochlorite of lime received at Lake Montebello and at Lake Roland, and of each solution, made daily or several times daily from this bleach, to govern the amount applied to the water. Numerous examinations of sand, paints and other miscellaneous materials were also made, and several studies, not of a routine nature, were conducted. Weekly bacteriological and chemical analyses were made on samples of water from Herring Run.

Twenty-eight thousand tubes of culture media, consisting of fifteen different kinds, five of which were only occasionally used, were required for the bacteriological work. These media were, of course, all made in the laboratory.

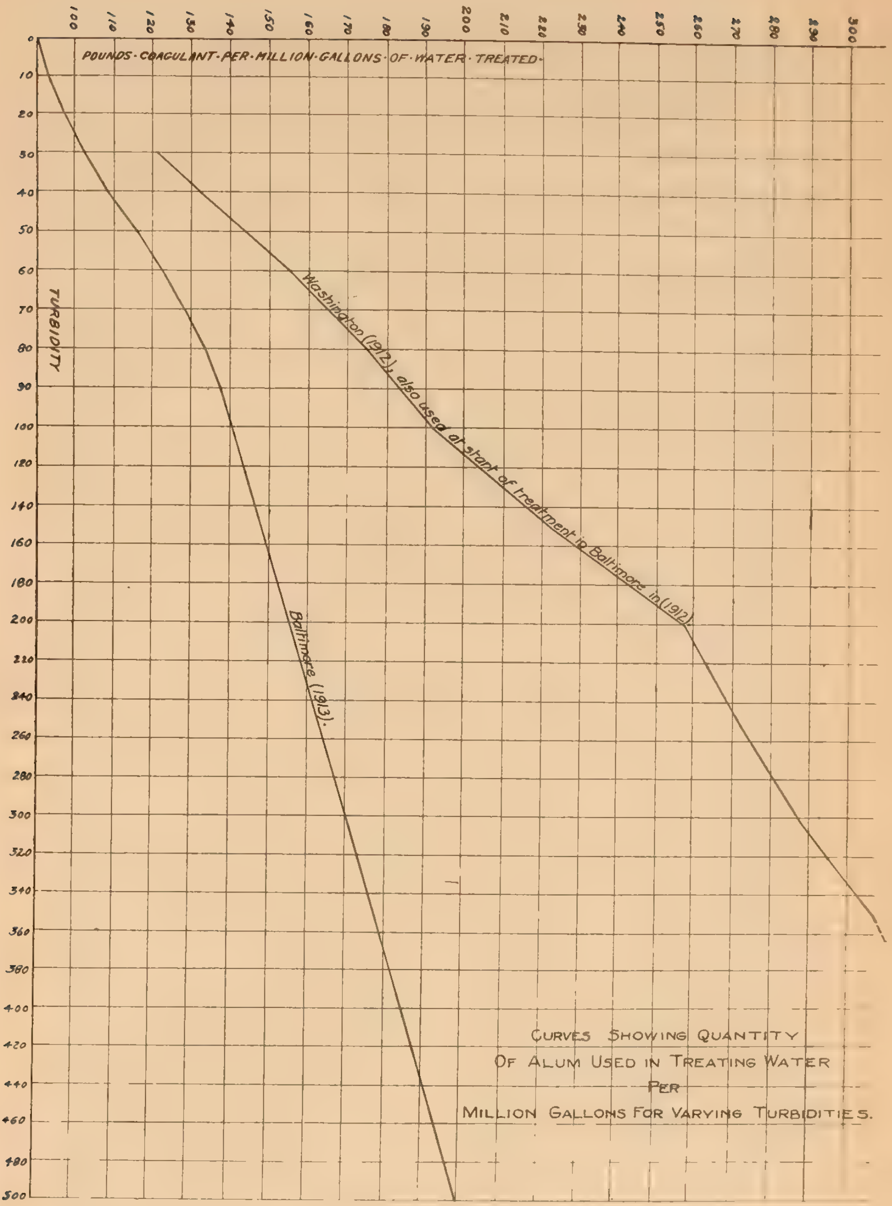
The various analyses are tabulated, in most cases, by monthly averages, as this gives more condensed tables and yet shows the varying quality of the water throughout the year. These results are shown in Tables Nos. 1 and 2. The exceptions to this procedure are with the city tap samples and the bacteriological samples from Lake Ashburton, Guilford Reservoir and High Service Reservoir. These samples were taken only four or five times a month, and it was necessary to average the fifty-two weekly samples to secure a trustworthy estimation of the B. coli group organisms. These results are given in Table No. 6. Tables Nos. 3, 4 and 5 show the averages of weekly analyses for the chemical and microscopical content.

In accordance with your suggestion, the daily analytical results have been tabulated in a manner provided by the recently proposed method whereby the variation in the quality of the water is very clearly shown in greater detail. These tables are Nos. 7 to 10, inclusive.

It must be borne in mind, if we should make a sum of the various B. coli group organisms in a particular reservoir, that this sum will be higher than would have been obtained by calling all such organisms B. coli communis or B. coli communior; because, many times, two or three different types of organisms were isolated from the same dilution of a sample, and without the special differentation which was made, these several types would have been considered the same organism and taken into account but once in forming the average.

During the year aluminum sulfate was used almost continuously in both supplies.

The amount of this coagulant applied depended upon the condition of the water as shown by the daily turbidity readings and bacteriological examinations. At first, tables prepared from those used in Washington were followed, but later the amounts were varied to better suit the local conditions. Graphs or curves were then plotted, and from them formulæ, to show the amount of alum to be applied for any turbidity were derived. This has effected a considerable saving in the amount of aluminum sulfate used. A copy of two of these curves is submitted with this report. They show the two amounts of aluminum sulfate in pounds per million gallons of water treated for varying turbidities. The upper curve represents the



Curves Showing Quantity
Of Alum Used in Treating Water
Per
Million Gallons for Varying Turbidities.

amounts used for the varying turbidities when the treatment was instituted and the lower curve indicating the amounts used at the present time.

The use of calcium hypochlorite was, of course, continued without interruption. The amount applied was varied several times during the year. In the Gunpowder River supply, 0.5 part of available chlorin per million parts of water was applied from January 1 to January 15 at Lake Montebello effluent, the water already in the lake having been previously treated at Loch Raven before the hypochlorite plant was moved to Montebello. From January 15 to June 22, 0.8 part per million was used; from this latter date until August 9, 1.0 part per million was used, when the amount was further increased to 1.5 parts, and this amount was continued until September 18, when the use of 2.0 parts per million was advised. As the amount of hypochlorite was increased from time to time, many complaints of the taste of the treated water were received, and a considerable amount of residual chlorin was found upon analysis of samples from various parts of the city. It was, therefore, decided to decrease the amount of chlorin applied, and from October 30 to November 30, 1.75 parts were used, while from November 30 to December 31, the amount was 1.5 parts per million.

In the Jones Falls supply the amounts of available chlorin applied were as follows: January 1 to May 24, 1.5 parts per million; May 25 to June 21, 1.25 parts per million; June 22 to August 8, 1.5 parts; August 9 to November 6, 2.0 parts; November 7 to November 29, 1.75 parts, and from November 30 to December 31, 2.0 parts per million. In consideration of the difficulty with which this supply is effectively treated, it was thought advisable to continue with the use of 2.0 parts per million of available chlorin.

The results of the routine work of the laboratory have furnished material for several interesting studies. One of these is a comparison of the relative numbers of certain types of gas-producing oragnisms isolated from the two sources of supply. There are nearly five times as many B. acidi lactici in the Gunpowder River as in Jones Falls, while there are but one and one-half times as many true B. coli communis and communior, and only one and one-fifth times as many B. (lactis) ærogenes. B. acidi lactici is an organism that is found in large numbers in sour milk and dairy waste, and in the Gunpowder River it is probably derived from the many dairy farms located on the water-shed. B. (lactis) ærogenes is usually present in sewage, and the B. coli organisms are seldom derived from any other source. It will be seen, therefore, that without this differential isolation of the members of the B. coli group, the Gunpowder River water would be considered twice as much contaminated with sewage as Jones Falls; whereas, it is probably no more than one and one-third as contaminated.

A comparison of the relative numbers of bacteria growing at 20 degrees C. and 37 degrees C. show that the ratio of the former to the latter is about ten to one in the yearly average, with a lesser ratio in the warmer weather. A striking fact brought out by one method of grouping the bacterial counts and gas-producing organisms is that the bacterial count increases in geometric progression as the members of the B. coli group were isolated from 10, 1, and 0.1 c.c.

Other studies have lead to the adoption of certain methods of technic that have resulted in a most satisfactory procedure for the numerical isolation of the several types of organisms which are useful in determining the quality of the waters examined.

During the year a number of apparently different types of gas-producing organisms have been secured from the routine examinations, and whenever time has permitted, work has been done upon the complete procedure of classifying them; but this work is long and tedious, and has not yet been completed.

Analyses of the inorganic residue of the Gunpowder River water were occasionally made, and an average of ten analyses show the following results:

Alkalinity	45.7
Lime value	56.7
Silica (as SiO_2)	12.5
Iron and alumina (as $Al_2O_3+Fe_2O_3$)	2.0
Calcium (as Ca)	12.1
Magnesium (as Mg)	5.6

The results of the purification of the two sources of supply furnish the basis of an interesting speculation regarding the probable chances of contracting typhoid fever by drinking these waters. The average number of cases of typhoid fever occurring per year during the five years, from 1905 to 1909, was 1,229. If we assume that 25 per cent. of the cases (a ratio sufficient to satisfy the severest critic) were caused by the water supply, the chances of having contracted the disease by this means were 51 in 100,000. Although the amount of water from the Jones Falls supply constituted only about one-fourth of the total consumption, the quality of the water is about the same as that of the Gunpowder River, and it may be assumed to have had its pro ratio share in the causation of typhoid fever. The average reduction in the members of the B. coli group, effected by the use of aluminum sulfate and calcium hypochlorite was 97.8 per cent. As the bacillus typhosis is more vulnerable to the treatment than the members of the B. coli group, it is reasonable to suppose that the organisms causing typhoid fever suffered a corresponding reduction. The logical sequence, therefore, is that for every hundred chances of contracting typhoid fever by drinking the untreated water, there are but 2.2 chances of contracting this disease by drinking the water after it has been treated; or, in other words, that the above mentioned chances of 51 in 100,000 being reduced by 97.8 per cent., the present chances of contracting typhoid fever by drinking the water as distributed to the city are 12 in one million. This, of course, is with the assumption that the water has not become very materially worse within the last five or six years; and any slight increase in pollution will have been more than compensated by attributing as many as 25 per cent. of the cases, prior to the installation of treatment, to the water supply.

In conclusion, I desire to commend the assistant bacteriologist, Mr. Edgar A. Sandman, and the laboratory assistant, Mr. J. Bernard Cole, for their ability, and to express my appreciation of their interest in the work and the faithful performance of their duties.

Yours respectfully,

J. Bosley Thomas, *Bacteriologist.*

(a) Started use of alum 4 P. M., January 29.
(b) After growths
(c) From August 1 to 15, when use of Lake Roland was discontinued.
(d) From August 15, water from Lake Clifton was mixed with remaining water.
(e) From September 11, when use of Lake Roland was resumed.

(f) To October 17, when use of Lake Roland was discontinued.
(g) From November 7, when use of Lake Roland was renewed.
(h) Use of alum in Lake Roland effluent (to Hampden influent) was discontinued November 30.
(k) Several high counts, probably due to water from the reservoir gaining access to the influent chamber.
(*) Per cent. reductions calculated with monthly averages carried to units place.

APPENDIX No. 6

Loch Raven Planting Plan.

(From Field Notes Made During Summer 1913).

Purpose.

This planting plan is a portion of a working plan which is to be drawn up for the management of the area of the water-sheds of the city's water supply at Loch Raven, Md.

The purpose of this plan is to establish a commercial forest on this water-shed, and to establish protective border plantings around the margin of the new impounding reservoir.

Only a small portion of the area of the water-shed is now covered with any sort of a forest formation, and the greater part of the area above the final "flow line" comprises good open farm land. In the planting, an effort will be made to afforest the area with our most valuable conifer. White pine has been chosen as the principal tree, because of its high technical quality, its rapidity of growth and its ease of management. (This seems to be somewhat far south for the optomum development of this conifer, but from the character of individuals of the species already growing on the area, it is safe to predict that the planting will be safe in this latitude.)

White pine adapts itself admirably for use on water-sheds, for it forms a cover rapidly, and early furnishes the protection from erosion and silting, which is so essential. A few of the most valuable hardwoods will be used to supplant the white pine, and in locations indicated on the map or later in this plan. The hardwoods which will be used are tulip, red oak and ash.

Border Planting.

A border planting will be established around the margins of the main water bodies. This planting will be four tree-spaces wide, or about 25 feet. White pine, Norway spruce and Eastern hemlock will be used in the mixture. Pine and spruce should form 40 per cent. each of the plantings, and hemlock the remaining 20 per cent. The hemlock is recommended because of its tolerance. The species will establish itself under the other species and form an under-story, which will not only be desirable from an aesthetic point of view, but will also form an effective barrier to leaves, debris, etc. The lower margin of the border planting will be 10 feet away from the final "flow line" (237). This leaves a narrow strip of land which would look well under grass.

Need of a Forest on the Water Shed.

The Gunpowder River serves as the boundary line between a large portion of Baltimore and Harford Counties—two of Maryland's most fertile agricultural counties. The drainage area of the river is, therefore, not protected to any appreciable extent by forest covers throughout the greater part of its course, and as a consequence, heavy storms now bring down large amounts of silt and other undesirable material. The city's land will eventually reach as far west as Cockeysville, and the establishment of a forest will, therefore, protect the drainage area for the last ten miles of its course. This protection will not only mean pure water, but the gradual "paying out" or equalization of the flow, the preventing of erosion on the steeper areas, and the formation of an attractive woodland which eventually can be lumbered at a profit.

Stock Used.

No attempt will be made to grow any stock from seed. The white pine will be purchased from New England forestry companies and placed directly in the field or in the nursery, where it will be held for a short time.

The hardwoods will be purchased as seedlings and held in the nursery for a short time. A small stock of pine and hardwoods will be held in the nursery to replant the failures and to produce larger stock for border plantings.

"Planted" Areas.

Transplants Required Per Acre.

Transplants will be spaced six feet by six feet. With this spacing, 1,210 transplants are required per acre. In case of a mixture, the proportion of each species will be given under the discussion of the area in question.

Size of Plants Best to Use.

The transplants are to be two-one stock: That is they have spent two years in the seed bed and one year in the transplant bed. This has proved to be the best stock, for such plants have stalky stems and fibrous root systems.

Method of Planting.

A mattock should be used in the operation. The sod for one square foot is cleared away from the proposed planting spot. The mattock should be buried at the edge of the space, and in such a manner that when the handle is pushed away from and to the right of the operator the edge will come to the surface in the center of the space. In the opening thus made a plant is put with the left hand, great care being taken to spread out the roots and to put them well down under the surface. The mattock is now released, the plant straightened and the earth packed about the roots with several vicious jabs with the heel. This is considered the fastest method of planting transplants. The rows should be kept parallel by the use of stakes as guides.

Treatment of the Site Prior to Planting.

Many of the sub-compartments are (as shown by the map) open farmland areas, and practically the only treatment required before planting will be that given under "Method of Planting."

Time of Planting.

The planting should be done as early in the spring as the frost is out of the ground. By this early work, advantage can be had of the rains of April and May, and the plants should be well rooted before the drying periods of summer.

Experience has shown that it is reasonable to expect a loss of at least 10 per cent. of the transplants set out. For filling blanks two-two stock is preferable, that is two-one stock which has been held in the nursery for a year.

Progress of the Planting.

The Dulaney Valley and Sweet Air Turnpike serves to divide the tract roughly into two compartments. The areas east of the Dulaney Valley will be planted first, and work is to begin here in the spring of 1914. This portion of the plan covers only 441.75 acres, but will be enlarged upon as rapidly as possible. The planting work done each season will depend upon the available labor and the length of the planting season.

Present Vegetation.

The largest amount of existing woodland on the Loch Raven tract is to be found on the rougher topography east of the proposed bridge. This woodland is of the "mixed hardwood" type, the following species being found: chestnut, chestnut oak, black and red oaks, tulip and pignut. The forestry attention necessary to put these areas in proper condition will be given in the working plan. Agricultural grasses form the principal ground cover of a large portion of the area and is the chief factor tending to retard the development of the young plants.

Mapping.

The areas to be planted have been divided into sub-compartments to facilitate referencing in the office. Roads, streams and vegetation cover have served as lines of division.

List of Sub-compartments.

	Acres.
10a	45.0
10b	118.8
10c	14.7
9a	41.8
9b	34.92
9c	87.2
9d	22.1
6a	4.6
6b	8.5
6c	9.2
6d	4.6
6e	18.4
6f	17.2
8a	8.5
8b	10.8
Total	441.75

(10 a)—This sub-compartment is bounded by the "flow line" and the proposed new road on the map. The area of the tract is 45 acres. At present a growth of rag weeds covers the ground, this having followed a crop of corn-ground wheat. The soil is somewhat clayey, but fertile and well drained. It is an excellent planting chance.

Recommendations—A border planting of pines, spruce and hemlock will be established along the "flow line" as described previously in this plan under "Border Planting." Use white pine over the entire area, except along the Dulaney Valley Branch. Here use red oak, tulip and ash in 50 per cent. mixture, with the pine for 100 feet on each side of the stream. Do not plant until the proposed road is completed. Plants required, 54,450.

(10 b)—Area very similar to 10 a. Same quality of soil and drainage. Use white pine in pure planting. Plant an occasional hard maple, hickory or white ash, in scattered fashion. Not over five per

cent. of these to be used in the planting. Area, 118.8 acres; plants required, 143,748.

(10 c)—Open farm land; rich soil; gentle slope to east. Use pure white pine, except for the border planting. Area, 14.7 acres; plants required, 27,387.

(9 a)—Open grass land, resulting from removal of crop of clover hay, summer of 1913. Good planting chance. Well drained, fertile soil. Few scattered old trees, which will not interfere with planting. Remove them later.

Recommendations—Use white pine, except along stream, with 10 per cent. of white ash or sugar maple. Use 10 per cent. tulip on area bordering the stream. Area, 41.8 acres; plants required, 50,578.

(9 b)—A gentle western slope, draining into Dulaney Valley Branch. Good fertile soil, quality No. 1. Open area. Covered with wheat stubbles or weeds. An orchard is present. Plant under these trees and remove old trees later.

Recommendations—Plant with pure white pine. Scatter 15 per cent. of red oak and tulip. Leave old Cromwells Bridge open as a fire line. Area, 34.9 acres; plants required, 41,229.

(9 c)—This area is the highest point on the east side of the Dulaney Valley. There is an abrupt slope to the west, which is covered at this time with sedge grasses and scrub pine (Pinus Virginiana) reproduction. A site which should be given early attention because of the character of the soil and topography. There is a small woodland area here.

Recommendations—Use hardwoods (sugar maple, hickory, red oak) on the knob in equal mixture—pure white pine over rest of area. Do not plant in the woodland area. This area will be handled as explained later in "The Working Plan." Area, 82.7 acres; plants required, 100,067.

(9 d)—Open grass land. Hay crop removed summer of 1913. Good soil and drainage. Good planting chance. No obstacles to planting. Few old scattered trees, which may be removed after planting.

Recommendations—Use white pine. Scatter few hardwoods (tulip and ash) with the pine. (Not to be more than five per cent. of these in planting.) Do not plant until after proposed road is completed. Area, 22.1 acres; plants required, 26,740.

(6 a)—Field of buckwheat in 1913. Small orchard. Good soil, draining into Dulaney Valley Branch.

Recommendations—Use tulip and ash in 50 per cent. mixture. Area, 4.6 acres; plants required, 5,560.

(6 b)—Low-lying, flat area. Very rich soil.

Recommendations—Use tulip and ash in 50 per cent. mixture. Area, 8.5 acres; plants required, 10,285.

Make border planting around the edge of water body, as given earlier in plan. Do not plant until proposed road is completed.

(6 c)—Area in corn, summer of 1913. Clean land, no obstacles to planting; good soil; eastern aspect good drainage.

Recommendations—Use pure white pine over entire area. Make border planting. Area, 9.2 acres; plants required, 11,132.

(6 d)—Tilled soil. Wheat planted fall of 1913. Quality of soil and drainage same as 6 c.

Recommendations—Use pure white pine, as in 6 c. Make border planting. Area, 4.6 acres; plants required, 5,566.

(6 e)—Excellent site, practically level. No vegetative obstacles. Fertile soil. Crop of hay removed summer of 1913.

Recommendations—Make border planting. Use white pine over entire area. Scatter 10 per cent. of tulip and ash in regular fashion. Area, 18.4 acres; plants required, 22,264.

(6 f)—Site same as 6 c, except that crop of corn is growing. Rolling to level. Clayey soil.

Recommendations—Use pure white pine over entire area. Area, 17.2 acres; plants required, 20,812.

Note—The Dulaney Valley and Sweet Air Turnpike, which forms the western boundary of sub-compartments 6 c, 6 d, 6 f, 8 a and 10 c, should be maintained as a fire line.

(8 a)—Cultivated field; being prepared for wheat or hay. A corn-ground wheat field ploughed.

Recommendations—Use white pine. Scatter 10 per cent. tulip through the portion nearest the water body. Make border planting. Area, 8.5 acres; plants required, 10 285.

(8 b)—Old pasture field. First sub-compartment to be planted in spring of 1913.

Recommendations—Use white pine with 40 per cent. hard maple. Area, 10.8 acres; plants required, 13,068.

Respectfully submitted,

R. Brooks Maxwell, *City Forester.*

APPENDIX No. 7

Report of the Pitometer Survey.

EVAN RINEHART, Engineer in Charge.

Mr. Ezra Whitman,
Water Engineer.

Dear Sir—The pitometer survey for the reduction of water waste and leakage started work in May, 1913. Its duties include:

(1) Night surveys of mains and connections for underground leakage.

(2) House-to-house inspection of water fixtures and service pipes.

(3) Designating for metering, such places as apartment houses, etc., that have large consumption.

(4) Reporting cases of miscellaneous water waste by street contractors, etc., for warning by the Water Engineer that their licenses will be revoked if the waste is not stopped.

(5) Compiling consumption data and curves.

Results.

A saving of about three million gallons per day, the value of which in pumpage and treatment, is 168 per cent. on the investment, or cost of the work. The work was mostly in Western High Service.

Records of actual pumpage, allowing for slip of pumps, before and after the survey, show a decrease of 4½ million gallons per day, bringing the Western High Service down to 13.8 million gallons per day, which was lower than it had been for years. Allowing 1½ million gallons per day, Eastern Station, pumping due to connecting Mount Royal, leaves a net saving of three million gallons per day. Survey records, allowing for leaks detected and repaired, show about two million gallons per day. The difference is due to the fact that 114 consumers of large amounts were reported for metering, that some work was done in cutting down waste by street contractors, and that every household inspected was warned about wasting water.

From a consumption chart (1910-1913): All the services, except the Western High Service, show the expected increases in consumption per day, as high as 18 per cent. (united service) for 1913 over 1912. The Western High Service, where the pitometer survey worked, decreased in average daily consumption, in spite of the large consumption by sewer manholes and the amount of work done by public contractors.

Taking three million gallons per day saved, at eight dollars per million gallons for pumping, treating and overhead charge, gives the value of the water saved as $8,760 per year, at a cost of $5,200. If the cost is considered of installation of plant, depreciation, etc., the saving is much higher. At the prevailing meter rates it would be about $85,000.

Sources of Leakage and Waste.

Leakage.

(1) Joints on mains, abandoned supplies, split services, electrolysis.

(2) House fixtures: Faucets, water closets, piping inside.

The records show that defective house fixtures are responsible for about 65 per cent. of the total leakage; broken services and private pipe for about 20 per cent., and leaks on mains, valves, hydrants, fountains and blows, for the remaining 15 per cent.

Waste.

(1) House fixtures: Automatic and continuous flush closets, non-automatic cellar drainers, domestic use of water in excess of actual needs.

(2) Manholes fitted with non-automatic drainers, street and building contractors using water greatly in excess of their actual needs.

The leakage and waste for the entire city is estimated at 19 million gallons per day.

Procedure of Work.

The section of the city surveyed was divided into districts of about one square mile. Taking a district survey, the preliminary measurement consisted in shutting off for one night all mains entering and leaving the district, excepting one feed main, and by means of a pitometer on the feeder, measuring the night flow of the district. Taking the flow from midnight to four o'clock in the morning, and deducting properly for fountains, horse-troughs and legitimate use, leaves the remainder classed as leakage and waste. The pitometer recorder chart, when calibrated, gives a visual record in gallons per day.

The house-to-house inspectors were then sent into the district, serving notices to repair leaking house fixtures and services. Each notice was personally handed to the tenant by the inspector. When all visible leaks had either been repaired or shut off, another survey of the district was made at night. By cutting out block by block, and noting the corresponding drop in the total flow, the night rate of each block was determined.

Consumption that could not be accounted for by the house-inspection reports was traced until located. Listening with an aquaphone on a hydrant key at the curb-cocks was effective when the curb-cocks were accessible, but in some cases it was necessary to strip the main.

Curb-Cocks.

The quickest and cheapest way to follow up a large flow at night in any particular block, would be to shut off the curb-cocks in order, noting the corresponding drops in the flow. This would locate all leakage as inside or outside the curb, and leaks on the mains could be readily traced. However, in this city, only a small proportion of the curb-cocks are available for use. In most cases, the curb-cock box is buried or plugged with concrete, brick-bats or dirt, or else there is no box enclosing the curb-cock, which is covered by the sidewalk. Also the curb-cock box that has been installed by the city for a number of years is of too small diameter for cleaning or working the curb-cock with the ordinary hydrant key. Shutting off a house at the curb-cock invariably means digging up the box and breaking the cement sidewalk. In cases of services broken inside of the curb, this often means a cellar flooded before the stop at the curb can be shut off, or else the time and expense of shutting down the main and pulling the ferrule.

I recommend that the property-owner be held accountable that the curb-cock is always accessible for use. With this end in view, a force could be organized to overhaul and install curb-cock boxes throughout the city, placing on the water bill of the property-owner the charge of the work involved, which would be about three dollars as a maximum for the installation of a new box.

Another method of tracing leaks on mains, by exposing the pipe at intervals, and listening with an aquaphone, is not desirable, because of the necessity of tearing up improved pavement.

The survey contemplates using for night work, a meter mounted on a wagon and fitted with several hundred feet of 2½-inch hose and connections for fire plugs. The plan is to feed the block tested from a fire plug on a main isolated from the one under test, through the hose and meter to a fire plug on a main in the block under test. This method is desirable because of the cost of each pitometer manhole and the official disfavor of breaking into improved paving, for installing pitometer taps. It also keeps the men working the valves in closer touch with the operator reading the flow.

The limited appropriation did not allow a very extensive night survey for underground leakage, and only about 50 leaks on the mains of any size, that did not come to the surface, were detected. Of the some thousand leaky joints which were repaired in the past year by the Water Department, the largest proportion of them showed on the surface, and in most cases, not far from the leak. However, with the big increase of improved paving, on concrete base, the proportion of leaks on mains which will follow underground channels to sewers or manholes, will increase rapidly unless caught up by the pitomer survey. Moreover, leaks of this character will do considerable damage by excavating under the improved paving before being discovered.

House-to-House Inspection.

Each inspector, properly equipped with a Department badge and a letter of instructions, goes from house to house in an assigned district and inspects all house fixtures. He then shuts off the cellar water stop and listens with an aquaphone for the sound of a leak on the service pipe. If there is a water fixture or service leaking about 100 gallons per day or over, the inspector hands to the tenant a notice giving the nature of the leak and stating that if repairs are not made in seven (or less for large leaks) days, the water will be turned off. A duplicate of the notice is turned in to the chief inspector, who shuts off the water if the repairs are not made in the stated time.

The daily report made by the inspector, a block of houses to a sheet, gives the type of building, number of inmates, location of cellar drainers, etc. This report is filed at the City Hall office for reference in the nightwork following the inspection. The record for the past year shows:

Number of buildings inspected	40,000
Number of leaking fixtures repaired	4,891
Number of supplies turned off for failure to repair	139
Cost of inspecting one building, inc. overhead charges (cts.)	5
Number of houses inspected per man per day	80
Extent of work (in square miles)	4

Tabulation of Leakage.

Number of leaking faucets repaired	2,155
Number of leaking water closets repaired	2,607
Number of leaking house boilers repaired	15
Number of leaking inside pipe and fittings	40
Number of leaking curb-cocks and hose connections	9
Total number of leaking house fixtures	4,826
Number of leaking private pipes repaired	48
Number of leaking supply pipes (inside curb)	65
Number of leaking supply pipes (outside curb)	7
Total number of leaking pipes repaired	120
Number of leaks on mains repaired	37
Number of services turned off for failure to make repairs	139
Number of places with large consumption reported for metering	114
Number of fixtures and premises found not paying water rent, reported to Collector of Water Rents and Licenses	42

Balance Sheet.

SAVING.

Three million gallons per day at $8 per million gallons		$8,760 00

*Property of the Department.

Miscellaneous Water Waste.

Non-Automatic Cellar Drainers or Syphons.

The total number of these in the city is not known; a minimum estimate gives 500. Most of these run as high as 3,000 gallons of city water per day. Syphons have been measured, running 8,000 gallons per day. Moreover, while they will be pumping the ground water for only a few hours in the day, they will be using city water throughout the entire 24 hours. At 3,000 gallons per day, this would amount to $87.60 if metered. The cost of the necessary valve and ball cock to change the non-automatic cellar drainer to that which automatically shuts off when the water has been drained, is five dollars to the plumber, and from eight to ten dollars to the property-owner.

The city is not only losing the revenue that it could charge for this water, but is also pumping a great deal of water and treating it with chemicals at an annual cost of from $1,800 to $2,400, depending on the number of non-automatic syphons in use. This cost will be doubled with filtration. Eighty per cent. of this cost is absolute waste, which could be prevented by compelling the installation of automatic attachments. With filtration, the cost of the above waste, capitalized, will amount to about $48,000.

Automatic or Continuous Flush Closets.

With the automatic type of water closet, the tank fills, flushes, and fills again, keeping this up throughout the entire 24 hours, at intervals of 45 seconds and longer. With the continuous-flush type, the water keeps running through the trough throughout the entire day. Closets of these types have been found to run 5,000 gallons per day, each. A great many are still in use, particularly in public and school buildings, having been installed under the mistaken idea that they are more sanitary than the usual type. The only remedy for buildings equipped with such a type of closet, if not publicly owned, is to either meter them or to compel the removal of the automatic attachments, under penalty of having the water shut off.

Public Waste of Water.

The public buildings are universally fitted with water fixtures that are extremely wasteful. This is particularly true of schoolhouses and of larger buildings, such as the Court House. This waste is largely due to the use of automatic flush closets as described above and other attachments, such as urinals and drinking fountains, continually running. Below are given some typical cases:

1. City Jail—Per capita, 620; consumption per day, 450,000 gallons; value at meter rates per year, $13,140.

2. Court House—per capita, 130; consumption per day, 130,000 gallons; value at meter rates per year, $3,796.

3. School No. 71—Per capita, 520; consumption per day, 36,300 gallons; value at meter rates per year, $677.

Considering that 45 gallons per capita (per person per day) is ample for every purpose of domestic use—washing, drinking, cooking and sanitation, it is clearly evident that public buildings waste from 60 to 95 per cent. of the water consumed. The total amount of water used in the city for public purposes is about 10 million gallons per day. Of this, at least six million gallons per day can be saved by, first, draining Electrical Commission and other manholes into sanitary sewers; second, installation of improved water fixtures and plumbing; third, metering and supervision of all water used by street and building contractors and by the Department of Street Cleaning. The six million gallons per day waste will cost the city about $26,000 per year and will increase as the present fixtures and equipment grow older.

Consumption.

The average consumption for 1913 was 75.18 million gallons per day. From the information on hand, this daily consumption is distributed approximately as follows:

	Million Gals. per Day.
Industrial and commercial	22
Domestic	24
Public use	10
Leakage and waste	19
Total	75

With the completion of the new Filtration Plant, the water will cost the city, exclusive of installation of plant, depreciation, etc., about $12 per million gallons for pumpage and filtering (two-thirds of entire supply will be by gravity). This gives an annual loss to the city from leakage and waste of water of $83,220, or about 2.25 cents on the tax rate.

The remedy for this waste is:

(1) Regulations for the public use of water as above mentioned.

(2) A permanent pitometer survey, with appropriations sufficient to allow of the survey of each main once a year and the inspection of each non-metered building three times each year, about $35,000.

(3) By newspapers and other means calling attention to the fact that the public pays for senseless waste of water on the tax bill, if not on the water rent.

In addition to these methods of prevention, there is that of metering all premises, which in itself is the most valuable aid to the reduction of leakage and waste.

As a comparison, and to show the importance that other cities attach to pitometer survey work, the following are some of the yearly appropriations:

Washington, D. C.	$38,000
Chicago, Ill.	163,147
Philadelphia, Pa.	84,000

Condition of the System.

Valves.

It is necessary to overhaul or clean the box of the majority of valves handled. A number of the valves have not been turned over for such a long time that the packing has hardened so that the stuffing box leaks considerably when the valves are worked. It is necessary at times to drop back several blocks before getting a tight shut-off, due to valves leaking through or to being covered over by dirt from trenches. The locations of valves, as shown on the office plats, are often misleading, unless the square has been measured up recently. All of this makes slow and costly work in getting a shut-off, especially in times of bad leaks or breaks on the mains. The recommendations for a division for the inspection and repair of all valves, particularly those ahead of improved paving has been embodied in a special report of August 12.

Fire Hydrants.

At present, in addition to the members of the Fire Department and Water Department, the street cleaning employees, sewerage contractors, and the paving contractors, are all allowed to take water from fire hydrants. It is a common practice to use Stilson wrenches, monkey wrenches, or anything except the plug key in turning on and off the water from these plugs. As a result, there are a number of fire hydrants throughout the city with stems so rounded and mutilated that they cannot be worked with the ordinary plug key. Also, the Water Department spends several thousand dollars each year on repairs to these plugs, the result of careless handling, failing to shut them off, etc.

Plans for 1914.

With the appropriation of $15,000 for 1914, the force will be increased by a draftsman, eight inspectors, one foreman and five laborers. With this force it is hoped to clean up the Low Service and the most of the Middle Service before the end of the year.

Appended is a curve of a four-day run on Low Service, showing the hourly fluctuations and also the leakage. Also photographs of various types of leakage.

Yours respectfully,

EVAN RINEHART,
Engineer in Charge of Pitometer Survey.
